New Amazon SOA-C02 Test Braindumps, SOA-C02 Reliable Exam Sample

If you prefer to study by your mobile phone, our SOA-C02 study materials also can meet your demand, because our learning

system can support all electronic equipment. You just need to download the online version of our SOA-C02 preparation questions, and you can use our products by any electronic equipment. We can promise that the online version will not let you down. We believe that you will benefit a lot from it if you buy our SOA-C02 Study Materials.

The SOA-C02 Certification Exam is a challenging exam that requires individuals to have a solid understanding of AWS services and best practices. SOA-C02 exam consists of 65 multiple-choice and multiple-response questions that must be completed within 130 minutes. To pass the exam, individuals must score 720 out of 1000 points. Individuals who fail the exam can retake it after a waiting period of 14 days.

Amazon AWS Certified SysOps Administrator - Associate (SOA-C02) Sample Questions (Q525-Q530):

NEW QUESTION # 525

A SysOps administrator manages a company's Amazon S3 buckets. The SysOps administrator has identified 5 GB of incomplete multipart uploads in an S3 bucket in the company's AWS account. The SysOps administrator needs to reduce the number of incomplete multipart upload objects in the S3 bucket.

Which solution will meet this requirement?

- A. Create an S3 Lifecycle rule on the S3 bucket to delete expired markers or incomplete multipart uploads
- B. Enable S3 Versioning on the S3 bucket that contains the incomplete multipart uploads.
- C. Require users that perform uploads of files into Amazon S3 to use the S3 TransferUtility.
- D. Create an S3 Object Lambda Access Point to delete incomplete multipart uploads.

Answer: A

Explanation:

To manage incomplete multipart uploads in an Amazon S3 bucket, creating an S3 Lifecycle rule to specifically address these uploads is the most effective method. The rule can be configured to automatically delete expired multipart upload parts, which helps in cleaning up unused data and reducing storage costs. Option A is correct as it directly addresses the requirement to manage incomplete uploads effectively. Reference on setting up S3 Lifecycle policies can be found here [Amazon S3 Lifecycle](#).

NEW QUESTION # 526

A company wants to monitor the security groups of its Amazon EC2 instances to ensure that SSH is not open to the public. If the port is opened, the company needs to close the port as soon as possible.

Which combination of actions should a SysOps administrator take to meet these requirements? (Select TWO.)

- A. Add an Amazon CloudWatch alarm to detect the security groups that allow SSH.
- B. Add an AWS Config rule to detect the security groups that allow SSH.
- C. Call AWS Systems Manager Run Command to close the port.
- D. Add an assessment template to Amazon Inspector to detect the security groups that allow SSH
- E. Call an AWS Systems Manager Automation runbook to close the port.

Answer: B,E

Explanation:

To monitor and automatically respond to security groups allowing SSH access:

* AWS Config: This service can be used to detect security groups that allow SSH access publicly (Option B). AWS Config continuously monitors and records your AWS resource configurations and allows you to automate the evaluation of recorded configurations against desired configurations.

* AWS Systems Manager Automation: This can automatically execute actions like closing the port when a non-compliant security group is detected (Option D). It allows the execution of automated workflows that can respond to Config rule findings, ensuring immediate remediation actions such as closing ports.

These two services combined offer a comprehensive solution to monitor, detect, and rectify unwanted security group configurations automatically. AWS documentation on AWS Config [AWS Config](#) and on Systems Manager Automation [Systems Manager Automation](#) provides additional insights.

NEW QUESTION # 527

An environment consists of 100 Amazon EC2 Windows instances The Amazon CloudWatch agent Is deployed and running on at

EC2 instances with a baseline configuration file to capture log files. There is a new requirement to capture the DHCP log files that exist on 50 of the instances. What is the MOST operational efficient way to meet this new requirement?

- A. Run the CloudWatch agent configuration file wizard on each EC2 instance and select the advanced detail level. This will capture the operating system log files.
- **B. Create an additional CloudWatch agent configuration file to capture the DHCP logs. Use the AWS Systems Manager Run Command to restart the CloudWatch agent on each EC2 instance with the append-config option to apply the additional configuration file.**
- C. Run the CloudWatch agent configuration file wizard on each EC2 instance. Verify that the base log files are included and add the DHCP log files during the wizard creation process.
- D. Log in to each EC2 instance with administrator rights. Create a PowerShell script to push the needed baseline log files and DHCP log files to CloudWatch.

Answer: B

Explanation:

The most operationally efficient way to capture DHCP log files on 50 of the 100 EC2 instances is to create an additional CloudWatch agent configuration file and use AWS Systems Manager Run Command to update the CloudWatch agent configuration.

* Create an Additional CloudWatch Agent Configuration File:

* Create a new CloudWatch agent configuration file that includes the settings to capture DHCP log files.

* Use AWS Systems Manager Run Command:

* AWS Systems Manager Run Command allows you to remotely and securely manage the configuration of your managed instances.

* Use the Run Command to restart the CloudWatch agent on each EC2 instance with the append-config option to apply the additional configuration file.

* Steps:

* Open the Systems Manager console.

* Choose "Run Command."

* Create a new command document or use an existing one that restarts the CloudWatch agent with the append-config option.

* Target the 50 specific EC2 instances.

Amazon CloudWatch Agent Configuration

AWS Systems Manager Run Command

NEW QUESTION # 528

A company's social media application has strict data residency requirements. The company wants to use Amazon Route 53 to provide the application with DNS services. A SysOps administrator must implement a solution that routes requests to a defined list of AWS Regions. The routing must be based on the user's location. Which solution will meet these requirements?

- A. Configure a Route 53 multivalue answer routing policy.
- B. Configure a Route 53 IP-based routing policy.
- **C. Configure a Route 53 geolocation routing policy.**
- D. Configure a Route 53 latency routing policy.

Answer: C

Explanation:

For routing based on the user's geographic location to comply with data residency requirements, the best solution is to use Amazon Route 53 geolocation routing policy. This policy allows you to configure DNS responses based on the geographic location of the user, ensuring that requests are directed to specific AWS Regions that align with the company's data residency requirements. Option C is correct. The AWS Route 53 documentation provides details on implementing geolocation routing policies. Amazon Route 53 Geolocation Routing.

NEW QUESTION # 529

A company wants to enhance its security by applying IAM permissions boundaries. The company tries to use IAM policy conditions and receives the following error:

"Error: error updating IAM Role (role-name) assume role policy:

AccessDenied: User: id-arn is not authorized to perform:

iam:UpdateAssumeRolePolicy on resource: role-role-name status code:

403, request id: request-id"

The policy that contains the condition includes the following snippet:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "CreateOrChangeOnlyWithBoundary",
      "Effect": "Allow",
      "Action": "UpdateAssumeRolePolicy",
      "Resource": "arn:aws:iam::123456789012:role/role-name",
      "Condition": {
        "StringEquals": {
          "iam:PermissionsBoundary":
            "arn:aws:iam::123456789012:policy/MyBoundaryPolicy"
        }
      }
    }
  ]
}
```

What is the reason for the error?

- A. IAM user id-arn is not allowed to assume role-name.
- B. Condition keys are not allowed in conjunction with permissions boundaries.
- C. The UpdateAssumeRolePolicy action is not compatible with the iam:PermissionsBoundary condition key.
- D. Permissions boundaries are not allowed with IAM policies.

Answer: C
