

Study CCRN-Pediatric Plan - CCRN-Pediatric Exam Dump

CCRN Pediatric Practice Exam Questions and Answers 2024 from AACN

To promote effective grieving in a 6-year-old sibling following the death of an infant, the nurse should:

- A) Recommend that the sibling not attend the infant's memorial service
 - B) Encourage the parents to minimize their expression of grief with the sibling
 - C) Explain to the sibling that the infant went to heaven
 - D) Explain to the sibling that thoughts and wishes did not cause the infant's death - Answer: D) Explain to the sibling that thoughts and wishes did not cause the infant's death: At age 6, children may take words literally and because of their egocentrism, they believe that thoughts are all-powerful. They may truly believe they caused the death of their sibling. A simple, honest explanation of why the sibling died is indicated. This intervention is consistent with Caring Processes.
- A) Recommend that the sibling not attend the infant's memorial service: This intervention is not a solution to the problem and will not promote effective grieving for the sibling. It is not consistent with Caring Processes.
- B) Encourage the parents to minimize their expression of grief with the sibling: This intervention will lead to ineffective grieving for the sibling and is not consistent with Caring Processes
- C) Explain to the sibling that the infant went to heaven: This intervention will not address the sibling's problem

A 5-year-old with a history of congenital hydrocephalus and VP shunt placement at four weeks of age is admitted with increased somnolence, decreased appetite, and increased complaints of headache. This morning the child vomited twice. The nurse should anticipate:

- A) The physician ordering lumbar puncture and blood and urine cultures
 - B) the patient having a CT scan followed by possible shunt revision
 - C) Administering mannitol or hypertonic saline
 - D) Administering phenytoin (Dilantin) or fosphenytoin (Cerebyx) - Answer: B) The patient having a CT scan followed by possible shunt revision: This patient is demonstrating signs of increased intracranial pressure. The most likely etiology is malfunction of the VP shunt as a result of blockage or disconnection, which is particularly likely over time as the child grows. The definitive diagnosis is made by a CT scan and a shunt series. Surgical intervention for a shunt revision would be indicated.
- A) The physician ordering lumbar puncture and blood and urine cultures: These interventions will not address the most likely primary problem, which is suspected VP shunt malfunction. Additionally, lumbar puncture is contraindicated in the presence of increased intracranial pressure, because downward herniation of the brainstem can occur.
- C) Administering mannitol or hypertonic saline: These medication are indicated for the medical management of increased intracranial pressure, of which this patient has

Real4Prep can satisfy the fundamental demands of candidates with concise layout and illegible outline of our exam questions. We have three versions of CCRN-Pediatric study materials and they are made for different habits and preference of you, Our PDF version of CCRN-Pediatric study guide is suitable for reading and printing requests. The second Software versions which are usable to windows system only with simulation test system for you to practice in daily life. The last App version of our CCRN-Pediatric

Exam Dump is suitable for different kinds of electronic products. And there have no limitation for downloading.

AACN CCRN-Pediatric (Critical Care Nursing) Certification Exam is a certification exam designed for nurses who work in critical care and are seeking to validate their knowledge and skills in pediatric critical care nursing. CCRN-Pediatric exam is administered by the American Association of Critical-Care Nurses (AACN), which is the largest specialty nursing organization in the world.

Obtaining the CCRN-Pediatric certification can benefit nurses in a variety of ways. It validates their clinical knowledge and skills, recognizes their commitment to the nursing profession, and can increase their earning potential. Additionally, nurses who hold this certification are viewed as leaders in their field, which can lead to career advancement opportunities and greater job satisfaction. The CCRN-Pediatric Certification is also a valuable asset for healthcare organizations that prioritize quality patient care and staff development.

AACN Critical Care Nursing Exam Sample Questions (Q91-Q96):

NEW QUESTION # 91

What is the best method to ensure parents of a child with a new tracheostomy are adequately prepared for home care?

- A. Use the parents' preferred method of learning and evaluate as they perform care
- B. Demonstrate tracheostomy care daily and address the parent's concerns and questions thoroughly
- C. Provide the parents a video to watch and include them in ADL care
- D. Give the parents written instructions and answer their questions

Answer: A

Explanation:

Education must be individualized based on the parent's learning style and comprehension. Combining demonstration, return demonstration, written materials, and verbal teaching—as preferred by the family—ensures the greatest retention and competence. Ongoing evaluation of skills is essential before discharge.

"Use of preferred teaching methods, with return demonstration and skill validation, ensures family readiness for complex care like tracheostomy management." (Referenced from CCRN Pediatric - Professional Caring and Ethical Practice: Family-Centered Teaching and Discharge Readiness)

NEW QUESTION # 92

Ada, tells the nurse that she wants to begin toilet training her 22-month-old child. The most important factor for the nurse to stress to the mother is:

- A. The mother's positive attitude
- B. Developmental level of the child's peers
- C. Consistency in approach
- D. Developmental readiness of the child

Answer: D

Explanation:

Explanation: If the child isn't developmentally ready, child and parent will become frustrated. Consistency is important once toilet training has already started.

NEW QUESTION # 93

The parents of a teenager with terminal neuroblastoma are preparing to withdraw life-sustaining treatment. The parent states, "I would like their sibling to be here, but I'm not sure if that is a good idea." Which of the following is the best response by a nurse?

- A. "The medical team supports the presence of siblings during end of life."
- B. "What concerns do you have about having the sibling present?"
- C. "Our child life therapist can help prepare the sibling for what will happen."
- D. "We require siblings to be a certain age. How old is the sibling?"

Answer: B

Explanation:

In end-of-life situations, especially involving pediatric patients, psychosocial support must extend to the entire family. When a parent expresses uncertainty or ambivalence, the nurse's role is to facilitate open communication and explore parental concerns without imposing judgment or directives.

"Effective psychosocial care requires assessment of family readiness and emotional state. Nurses should encourage family expression of feelings and help clarify concerns before offering direction or education." (Referenced from CCRN Pediatric - Direct Care: Psychosocial Support and Palliative Care) By asking about the parent's concerns, the nurse promotes a therapeutic relationship and gains insight into the family's emotional and cultural dynamics, allowing further support or child life referrals as needed.

NEW QUESTION # 94

An adolescent is admitted with toxic shock syndrome. In addition to blood cultures, which of the following lab orders should a nurse anticipate?

- A. Procalcitonin and teg citrate
- B. Liver function test and teg citrate
- C. Lactate and procalcitonin
- D. Liver function test and lactate

Answer: C

Explanation:

Toxic shock syndrome (TSS) is a systemic inflammatory response caused by bacterial exotoxins, often leading to shock and multiorgan failure. Procalcitonin helps confirm bacterial sepsis, and lactate is a marker for tissue hypoperfusion—both critical in TSS workup.

"In systemic infections and toxic shock, procalcitonin supports diagnosis of bacterial origin, while lactate levels reflect perfusion and guide resuscitation." (Referenced from CCRN Pediatric - Direct Care: Multisystem, Sepsis and Toxic Shock Syndrome)

NEW QUESTION # 95

A father of a 16 year old who has sickle cell anemia tells a nurse that his family is scheduled to go camping this summer. He asks what activity would be appropriate for his child. The nurse would suggest:

- A. Motorboat ride around the lake.
- B. Fresh water swimming
- C. Collecting logs to be use for campfire
- D. Biking around the lake

Answer: A

Explanation:

Explanation: The activity doesn't require high amount of oxygen. The goal is to prevent sickling, therefore activities which may lead to increased cellular metabolism and increased tissue hypoxia should be avoided.
