WGU Managing Cloud Security (JY02) Sample Questions (Q79-Q84):

NEW QUESTION # 79

An engineer needs to create segmentation using the built-in tools provided by the company's cloud provider. The InfoSec team has given the engineer directions to limit traffic using a security group between two cloud deployments in the organization. Which mechanisms should the engineer use to create this segmentation?

- A. MAC addresses and protocols
- B. Unique identifiers and protocols

- C. Definitions and protocols
- **D. Ports and protocols**

Answer: D

Explanation:

Cloud security groups typically filter traffic based on ports and protocols. By allowing or denying specific port/protocol combinations, engineers can control communication between deployments. For example, permitting HTTPS (TCP port 443) while blocking other ports enforces segmentation.

MAC addresses are not used in cloud-level segmentation because they apply to physical networks. Unique identifiers and definitions are not practical mechanisms for traffic filtering.

Using ports and protocols aligns with the principle of least privilege by ensuring that only necessary communication pathways exist. In multi-deployment or hybrid cloud setups, this reduces the attack surface and prevents lateral movement by malicious actors. Security groups thereby provide logical network segmentation without requiring physical infrastructure changes.

NEW QUESTION # 80

An organization's help desk receives a call from a person claiming to be an employee wanting to verify their home address on file. The caller answers the basic authentication questions, so the help desk employee provides them the sensitive information. The organization later discovers that this call was fraudulent. Which type of threat does this represent?

- **A. Social engineering**
- B. Internal threats
- C. Man-in-the-middle attacks
- D. Escalation of privilege

Answer: A

Explanation:

This is an example of social engineering, where attackers manipulate individuals into divulging confidential information or performing actions that compromise security. In this case, the fraudulent caller convinced the help desk to disclose sensitive employee data.

Man-in-the-middle attacks involve intercepting communication between parties, escalation of privilege involves gaining higher access rights, and internal threats come from legitimate insiders. None of these fit the situation as accurately as social engineering.

Social engineering exploits human trust rather than technical vulnerabilities. Common tactics include phishing, pretexting, and phone-based fraud (vishing). Preventing such threats requires strong identity verification processes, employee awareness training, and layered authentication mechanisms. By recognizing the human element as a weak point, organizations can better prepare staff to resist manipulative tactics.

NEW QUESTION # 81

An organization is implementing a new hybrid cloud deployment and wants all employees to provide a username, password, and security token before accessing any of the cloud resources. Which type of security control is the organization leveraging for its employees?

- A. Web application firewall (WAF)
- B. Authorization
- **C. Authentication**
- D. Access control list (ACL)

Answer: C

Explanation:

The requirement for a username, password, and security token describes authentication—the process of verifying the identity of a user. By requiring multiple factors (something you know + something you have), the organization is implementing multifactor authentication (MFA).

Authorization defines what resources a user can access after authentication. WAFs protect web applications, and ACLs specify rules for allowed or denied traffic, but neither validate user identity.

Authentication ensures that only legitimate users gain access to cloud resources. In hybrid environments, MFA is a strong safeguard against credential theft and phishing attacks, providing assurance that identities are genuine before authorization decisions are made.

NEW QUESTION # 82

Which activity is within the scope of the cloud provider's role in the chain of custody?

- A. Initiating and executing incident response
- B. Setting data backup and recovery policies
- C. Classifying and analyzing data
- **D. Collecting and preserving digital evidence**

Answer: D

Explanation:

In cloud environments, the provider's role in the chain of custody primarily involves collecting and preserving digital evidence when incidents or investigations occur. Because providers manage the infrastructure, they have direct access to logs, storage systems, and virtual machines necessary for evidence collection.

Backup policies and incident response may involve collaboration, but they remain customer responsibilities in many service models. Data classification and analysis are business-driven tasks, which customers must handle.

Providers must ensure that evidence collection is forensically sound and documented properly to maintain legal admissibility. This responsibility is critical in maintaining trust and ensuring compliance with laws and contractual obligations. It reinforces the shared responsibility model by clearly defining which aspects of digital forensics belong to the provider.

NEW QUESTION # 83

Which design pillar encompasses the ability to support development and run workloads effectively, gain insights into operations, and continuously improve supporting processes to deliver business value?

- **A. Operational excellence**
- B. Sustainability
- C. Reliability
- D. Performance efficiency

Answer: A

Explanation:

The Operational Excellence pillar emphasizes practices that allow organizations to develop, deploy, and operate workloads effectively. It includes monitoring operations, responding to incidents, and continuously improving processes. By embedding feedback loops, organizations enhance agility and ensure that technology supports business value.

Performance efficiency deals with using computing resources efficiently, reliability ensures system availability, and sustainability focuses on environmental responsibility. While important, these do not encompass the process-driven improvements at the heart of operational excellence.

Operational excellence ensures that organizations can adapt quickly to changes, implement automation, and drive consistent improvements across cloud workloads. It is a key principle in cloud frameworks like AWS Well-Architected, Microsoft CAF, and Google's Reliability Engineering practices.
