

Superb 1z0-076 Exam Questions Supply You Marvelous Learning Dumps - PassTestking

BONUS!!! Download part of PassTestking 1z0-076 dumps for free: https://drive.google.com/open?id=1Q53_evZ2xtGg2unwMCuXkPQG1DY87ds

Several advantages we now offer for your reference. On the one hand, our 1z0-076 learning questions engage our working staff in understanding customers' diverse and evolving expectations and incorporate that understanding into our strategies, thus you can 100% trust our 1z0-076 Exam Engine. On the other hand, the professional 1z0-076 study materials determine the high pass rate. According to the research statistics, we can confidently tell that 99% candidates have passed the 1z0-076 exam.

Oracle 1z0-076 Exam Syllabus Topics:

Topic	Details
Topic 1	• Patching and Upgrading Databases in a Data Guard Configuration: This section provides guidance on patching and upgrading databases in a Data Guard environment, along with performance optimization techniques and monitoring considerations.
Topic 2	• Managing Oracle Net Services in a Data Guard Environment: The section focuses on Oracle Net Services and its role in Data Guard networking setup.
Topic 3	• Using Flashback Database in a Data Guard Configuration: This topic covers the configuration and advantages of using Flashback Database in a Data Guard setup, as well as the process of enabling fast-start failover for seamless role changes.

Topic 4	• Oracle Data Guard Basics: This topic covers the essential architecture and concepts of Oracle Data Guard. It includes sub-topics such as the physical and logical standby database comparison, benefits of Data Guard, and its integration with multi-tenant databases.
Topic 5	• Creating a Logical Standby Database: This topic guides users through the process of creating and managing a logical standby database, including SQL Apply filtering.
Topic 6	• Enhanced Client Connectivity in a Data Guard Environment: This topic focuses on enhancing client connectivity in a Data Guard setup and implementing failover procedures for seamless client redirection. It also covers application continuity to ensure uninterrupted operations during role transitions.
Topic 7	• Creating a Data Guard Broker Configuration: This section delves into the practical aspects of creating and managing a Data Guard broker configuration, including command-line and Enterprise Manager approaches.
Topic 8	• Backup and Recovery Considerations in an Oracle Data Guard Configuration: In this topic, Backup and recovery procedures in a Data Guard configuration are discussed, including RMAN backups, offloading to physical standby, and network-based recovery.
Topic 11	• Using Oracle Active Data Guard: Supported Workloads in Read-Only Standby Databases: Here, the usage of physical standby databases for real-time queries is discussed.

1z0-076 New Practice Materials - Brain Dump 1z0-076 Free

You may urgently need to attend 1z0-076 certificate exam and get the 1z0-076 certificate to prove you are qualified for the job in some area. But what certificate is valuable and useful and can help you a lot? Passing the 1z0-076 test certification can help you prove that you are competent in some area and if you buy our 1z0-076 Study Materials you will pass the 1z0-076 test almost without any problems. There are many benefits after you pass the 1z0-076 certification such as you can enter in the big company and double your wage.

Oracle Database 19c: Data Guard Administration Sample Questions (Q70-Q75):

NEW QUESTION # 70

Which THREE are among the various tasks performed by the Data Guard Monitor (DMON) process?

- A. communicating with dkon processes in other database instances that are part of the broker configuration
- B. activating role-based services appropriately in the various database instances of the configuration, based on the database role
- C. maintaining information about all members of the broker configuration in binary configuration files.
- D. communicating with the DMON process of the observer to monitor a primary database in case a fast start failover is required
- E. performing role transitions when switchover requests are made

Answer: B,C,E

Explanation:

The Data Guard Monitor (DMON) process is a key component of Oracle Data Guard. It plays a crucial role in managing and monitoring the state of both the primary and standby databases in a Data Guard configuration.

Performing role transitions when switchover requests are made (A): DMON is responsible for coordinating the switchover process between the primary and standby databases. This involves safely transitioning the roles of the databases to ensure data protection and availability.

Maintaining information about all members of the broker configuration in binary configuration files (B): DMON maintains detailed information about the databases in the Data Guard configuration, including their roles, states, and network addresses. This information is stored in binary configuration files, which are used by the Data Guard Broker to manage the Data Guard environment.

Activating role-based services appropriately in the various database instances of the configuration, based on the database role (C):
DMON activates services that are appropriate for the role of each database in the Data Guard configuration. For example, it may activate different services on a primary database than on a standby database, based on the specific requirements of each role.

NEW QUESTION # 71

Attempting to start the observer raises an error:

```
DGMGRL> start observer;
```

DGM-16954: Unable to open and lock the Observer configuration file

Failed.

Identify two possible ways to start the observer successfully.

- A. Start the observer in a different working directory.
- B. Create a broker configuration and enable Fast-Start Failover before starting the observer.
- C. Set the ObserverOverride property to TRUE before starting the observer.
- D. Start the observer using a different observer configuration file.
- E. Enable Fast-Start Failover before starting the observer.

Answer: A,D

NEW QUESTION # 72

Which three actions are performed by the START PLAN procedure of the DBMS ROLLING package?

- A. converting the designated physical standby database into a logical standby database
- B. starting media recovery on all the Leading Group Standby databases
- C. building a LogMiner dictionary on the primary database instance
- D. switching the primary database to the logical standby role
- E. creating a guaranteed restore point on the standby databases
- F. creating a guaranteed restore point on the primary database

Answer: C,E,F

Explanation:

The DBMS_ROLLING package facilitates a rolling upgrade process across a Data Guard configuration. The START PLAN procedure in particular handles several critical actions, including:

Creating a guaranteed restore point on the standby databases (B): This ensures that the standby databases can be reverted to their state before the rolling upgrade process in case of any issues.

Building a LogMiner dictionary on the primary database instance (C): This is necessary for logical standby databases to interpret redo data during the SQL Apply process.

Creating a guaranteed restore point on the primary database (D): Similar to the standby databases, this ensures that the primary database can be reverted to a known good state if necessary.

NEW QUESTION # 73

Which three are prerequisites for enabling Fast-Start Failover?

- A. The maximum protection mode can be used, but with two or more standby databases.
- B. You can specify only one standby database as the fast-start failover target.
- C. The Data Guard environment must be managed by the Data Guard Broker.
- D. The configuration must be operating in either Maximum Performance or Maximum Protection mode.
- E. Flashback Database must be enabled on both the primary database and the Fast-Start Failover target standby database.
- F. Flashback Database must be enabled only on the Fast-Start Failover target standby database.

Answer: B,C,E

Explanation:

To enable Fast-Start Failover in a Data Guard environment, the following conditions must be in place:

- * The Data Guard environment must be managed by the Data Guard Broker (A): The Broker simplifies management tasks and is required to enable fast-start failover, which is an automatic failover mechanism provided by Data Guard.

- * You can specify only one standby database as the fast-start failover target (C): Fast-start failover is designed to fail over to a single, predetermined standby database, known as the target standby.

- * Flashback Database must be enabled on both the primary database and the Fast-Start Failover target standby database (F):

Flashback Database provides a quick way to revert a database to a point

- * in time before a logical or physical corruption or error occurred. It must be enabled on both the primary and target standby databases to allow for the possibility of reinstating the old primary as a standby after a failover.

NEW QUESTION # 74

Examine the Data Guard configuration:

```
DGMGRL> show configuration;

Configuration - Animals

Protection Mode: MaxAvailability

Databases:
dogs - Primary database
cats - Physical standby database
sheep - Physical standby database

Fast-Start Failover: DISABLED

Configuration Status:

ORA-01034: ORACLE not available
ORA-16625: cannot reach database "dogs"
DGM-17017: unable to determine configuration status
```

Which three will be true after a successful failover to Cats?

- A. The configuration will be in Maximum Availability mode.
- B. The configuration will be in Maximum Performance mode.
- C. Dogs will be in the disabled state and has to be manually reinstated.
- D. Sheep will be in the enabled state.
- E. Sheep will be in the disabled state.

Answer: A,C,D

Explanation:

After a successful failover to the 'cats' database in a Data Guard configuration:

B: Sheep, being another standby database, would typically remain in the enabled state unless specifically disabled or if there was a configuration issue.

D: Dogs, which was the primary database prior to failover, will be in a disabled state as part of the failover process. Manual intervention is required to re-establish 'dogs' as a standby database or to return it to the primary role through another role transition.

E: If the configuration was in Maximum Availability mode before failover, it would remain in this mode after failover, provided all settings were properly configured and no changes were made to the protection mode.

Option A is incorrect because failover does not automatically change the protection mode to Maximum Performance. The protection mode remains as it was prior to the failover unless manually altered.

NEW QUESTION # 75

.....

PassTestking knows the importance of the Oracle 1z0-076 certification exam in the field of information technology. That is why it has prepared the remarkable Oracle 1z0-076 exam questions to help the aspirants pass it on the first go. The desiring candidates for the Oracle 1z0-076 certificate need help to find reliable 1z0-076 Exam Questions study material.
