Supermicro MI300X Expert (SMI300XE) Certification Exam Sample Questions (Q31-Q36):

NEW QUESTION # 31

When removing the GPU tray, why is it important that you keep it straight?

- A. You won't be able to set it on your work surface if you don't.
- B. Because of the screws on either side of the tray.
- C. The GPU tray only slides in or out at a 16-degree angle.
- **D. Movement can damage the upper portion of the chassis or the fans below the GPU tray.**

Answer: D

Explanation:

When removing the GPU tray, it is crucial to keep it level to prevent damage to the chassis and cooling fans below.

- * Option A (Correct): If the tray tilts, it can hit the upper chassis or damage fans below.
- * Option B (Incorrect): There is no specific 16-degree angle requirement.
- * Option C (Incorrect): Work surface placement does not impact removal safety.
- * Option D (Incorrect): The screws must be removed first, but they do not affect the removal angle.

NEW QUESTION # 32

When removing the GPU tray, where are the two screws located that must be loosened to allow the handles to be pulled out/down?

- A. Top of the GPU tray
- B. Bottom of the GPU tray
- C. One on top and one on bottom of the GPU tray
- **D. One on each side of the GPU tray**

Answer: D

Explanation:

To remove the GPU tray, you need to loosen two screws located one on each side of the tray.

- * Option B (Correct): There is one screw on each side that must be loosened before pulling the handles out/down.
- * Option A (Incorrect): The screws are not only on the top.
- * Option C (Incorrect): The screws are not only on the bottom.
- * Option D (Incorrect): There is no screw configuration with one on top and one on the bottom.

NEW QUESTION # 33

What is the main reason the AGFHC tool is not functioning properly?

- **A. CPU 2 is missing and the AGFHC requires 2 CPUs.**
- B. Missing 1 or more GPUs in the system.
- C. PSU needs to be reseated.
- D. Missing 1 DIMM in the system.

Answer: A

Explanation:

The AGFHC tool requires a dual-CPU setup to function properly. If CPU 2 is missing, the tool fails to operate correctly.

- * Option A (Incorrect): The tool does not depend on DIMM configuration.
- * Option B (Incorrect): Missing GPUs can cause errors, but the tool can still function.
- * Option C (Correct): AGFHC requires both CPUs to be installed.
- * Option D (Incorrect): PSU reseating is not required for AGFHC operation.

NEW QUESTION # 34

What are the 4 key statistical information points to note from the ROCm commands output? Choose 4 answers.

- **A. Energy Counter**
- **B. Firmware Details**
- **C. Power Draw**

- D. vBios
- E. Socket Type
- F. Temperature

Answer: A,B,C,F

Explanation:

The ROCm command output provides essential GPU performance metrics:

- * Option A (Correct): Energy Counter tracks GPU power consumption.
- * Option B (Correct): Firmware Details provide GPU firmware version.
- * Option C (Correct): Temperature shows real-time thermal readings.
- * Option E (Correct): Power Draw gives GPU power usage data.
- * Option D (Incorrect): vBios is not a key ROCm statistic.
- * Option F (Incorrect): Socket Type is not included in ROCm statistics.

NEW QUESTION # 35

The ROCm commands are not providing output or are failing. What could be the primary reason why? And how can you validate the reasoning?

- A. The GPU baseboard may not be detected. You can determine this by opening the IPMI GUI and reviewing the FW section.
- B. You suspect there are GPUs not detected. To determine which GPUs are missing, open the IPMI GUI and review the GPU component section to make sure all GPUs are present.
- C. If more than 3 GPUs are missing, then ROCm commands will not function. We need to verify that the 3 are missing in the IPMI GUI and review the GPU component section to make sure that at least 2 or fewer GPUs are missing.
- D. CPU is not installed correctly on the server. Review the OS dmesg logs for any odd CPU messages, then if located proceed to reseat the CPU.

Answer: B

Explanation:

If ROCm commands fail to provide output, the primary issue is likely missing or undetected GPUs. The best way to validate this is by checking the IPMI GUI and reviewing the GPU component section to ensure that all GPUs are present.

- * Option A (Correct): Missing GPUs are the most common cause of ROCm failures. The IPMI GUI provides visibility into which GPUs are detected.
- * Option B (Incorrect): CPU misalignment would cause general system failure, not ROCm-specific issues.
- * Option C (Incorrect): The GPU baseboard status can be checked in IPMI but is not the primary cause of ROCm failures.
- * Option D (Incorrect): ROCm can function with multiple missing GPUs, but the key issue is confirming GPU presence first.
