Supermicro MI300X GPU Service Specialist (SMI300XS) Exam Sample Questions (Q43-Q48):

NEW QUESTION # 43

You must remove the motherboard tray from the chassis before you can access the NVMe backplane.
True or False?

- A. False
- **B. True**

Answer: B

Explanation:

In Supermicro MI300X GPU systems, the NVMe backplane is located behind the motherboard tray, meaning the tray must be removed first.

Why is this step necessary?

- * The NVMe backplane is physically secured behind the motherboard tray to support high-speed PCIe connectivity.
- * Removing the motherboard tray provides clear access to NVMe connectors and MCIO cables.
- * Skipping this step may cause unnecessary strain on cables, leading to potential connector damage.

Official Documentation Reference:

* Supermicro Service Guide for NVMe Systems confirms that the motherboard tray must be removed first before working on the NVMe backplane.

NEW QUESTION # 44

To disengage a PCIe, motherboard, or GPU tray on the AS-8125GS-TNMR2 system, loosen the screws on either side of the tray, then slowly pull the tray out to disengage it. True or False?

- A. False
- **B. True**

Answer: B

Explanation:

Why Must the Screws Be Loosened First?

- * The PCIe, motherboard, and GPU trays in Supermicro MI300X systems are secured by screws on both sides to ensure:
 - * Structural stability
 - * Vibration resistance
 - * Secure connection of PCIe lanes and data paths

Proper Tray Removal Process:

#Step 1: Identify the tray to be removed (PCIe, motherboard, or GPU). #Step 2: Loosen screws on both sides to release tension on the tray. #Step 3: Slowly and evenly pull the tray out to avoid damaging connectors. #Step 4: Support the tray from the bottom while sliding it out to prevent bending.

Why This Method Is Important?

- * Preventing Connector Damage# Pulling the tray without loosening screws could damage PCIe connectors or misalign the board.
- * Avoiding Strain on Other Components# A stuck tray could put pressure on adjacent cables and connectors.
- * Ensuring a Safe Removal# The slow and controlled movement reduces the risk of accidentally dropping or flexing the tray.

Why False Is Incorrect?

* If false were correct, it would suggest that the tray can be removed without loosening screws, which is not possible due to the secure mounting system.

Official Documentation Reference:

* Supermicro AS-8125GS-TNMR2 Hardware Maintenance Guide confirms that loosening screws and carefully pulling the tray out is the correct disengagement procedure.

NEW QUESTION # 45

Exhibit:

There is a flap door over the ribbon cable connection. To open it, use your finger to press down on the top of the flap door and pop it open. True or False?

- A. False
- **B. True**

Answer: B

Explanation:

The flap door mechanism is a protective feature in Supermicro MI300X systems designed to secure ribbon cable connections.

How to open it correctly?

- * Press down on the top of the flap door# This disengages the locking mechanism.
- * The flap door will "pop open" safely without damaging the ribbon cable.
- * Forcing the flap without pressing down properly may break the connector.

Official Documentation Reference:

* Supermicro AS-8125GS-TNMR2 Maintenance Manual provides specific instructions on pressing down the flap door before opening it.

NEW QUESTION # 46

In the example system configuration shown in the video, is there an AOM card in the right AOM bracket?

- A. Yes
- B. I didn't watch the video
- **C. No**
- D. Maybe

Answer: C

Explanation:

The AOM (Add-On Module) bracket is used to mount optional components like:

- * RAID controllers
- * Additional networking interfaces
- * BMC/IPMI modules

In the example system shown in the video, the right AOM bracket does not contain an AOM card. This is because:

- * Supermicro's default system configurations do not always ship with optional AOM cards.
- * The left AOM bracket usually houses optional RAID or networking expansions, but the right bracket remains unoccupied unless a specific expansion module is installed.

Official Documentation Reference:

- * Supermicro Hardware Deployment Guide confirms that the right AOM bracket is optional and not pre-installed in base configurations.

NEW QUESTION # 47

What equipment is required in order to remove the heatsink from the motherboard tray?

- A. T30 Torx bit
- B. T40 Torx bit
- C. T20 Torx bit
- D. PH2 Phillips screwdriver

Answer: A

Explanation:

To remove the heatsink from the motherboard tray, a T30 Torx bit is required. This tool ensures proper torque application and prevents damage to both the heatsink and the motherboard.

Why a T30 Torx bit is necessary?

- * Supermicro MI300X GPU systems use precision heatsink retention mechanisms.
- * The heatsink screws are secured with factory torque settings and require a T30 Torx bit for safe removal.
- * Using an incorrect tool (Phillips screwdriver, T20, or T40) can strip the screw heads, making it difficult to remove the heatsink without causing damage.

Incorrect Answers Explained:

- * A (PH2 Phillips screwdriver) # Not strong enough for heatsink screws, which require high torque for proper seating.
- * C (T20 Torx bit) # Too small, risks stripping the screws.
- * D (T40 Torx bit) # Too large, does not fit the heatsink screws.

Official Documentation Reference:

- * Supermicro MI300X Service Manual specifies that a T30 Torx bit must be used to remove the heatsink without damaging the motherboard.
