CompTIA Security+ Certification Exam SY0-701 Prüfungsfragen mit Lösungen (Q249-Q254):

249. Frage
Which of the following attacks primarily targets insecure networks?

- A. Impersonation
- B. Watering hole
- C. Evil twin
- D. Pretexting

Antwort: C

Begründung:
An evil twin attack involves setting up a fraudulent Wi-Fi access point that mimics a legitimate one to intercept network traffic or steal credentials. This attack exploits insecure wireless networks and is focused on network infrastructure.
Impersonation, watering hole, and pretexting are social engineering or web-based attacks, not primarily network attacks.
The evil twin attack is a well-known wireless threat discussed under Threats and Vulnerabilities in SY0-701 #6:Chapter 2 CompTIA Security+ Study Guide#.

250. Frage
Which of the following is a reason environmental variables are a concern when reviewing potential system vulnerabilities?

- A. In-memory environmental variable values can be overwritten and used by attackers to insert malicious code.
- B. Environmental variables define cryptographic standards for the system and could create vulnerabilities if deprecated

algorithms are used.
- C. Environmental variables will determine when updates are run and could mitigate the likelihood of vulnerability exploitation.
- D. The contents of environmental variables could affect the scope and impact of an exploited vulnerability.

Antwort: D

251. Frage
A company hired a consultant to perform an offensive security assessment covering penetration testing and social engineering.
Which of the following teams will conduct this assessment activity?

- A. White
- B. Red
- C. Purple
- D. Blue

Antwort: B

Begründung:
A red team is a group of security professionals who perform offensive security assessments covering penetration testing and social engineering. A red team simulates real-world attacks and exploits the vulnerabilities of a target organization, system, or network. A red team aims to test the effectiveness of the security controls, policies, and procedures of the target, as well as the awareness and response of the staff and the blue team. A red team can be hired as an external consultant or formed internally within the organization.

252. Frage
A security analyst and the management team are reviewing the organizational performance of a recent phishing campaign. The user click-through rate exceeded the acceptable risk threshold, and the management team wants to reduce the impact when a user clicks on a link in a phishing message. Which of the following should the analyst do?

- A. Place posters around the office to raise awareness of common phishing activities.
- B. Update the EDR policies to block automatic execution of downloaded programs.
- C. Create additional training for users to recognize the signs of phishing attempts.
- D. Implement email security filters to prevent phishing emails from being delivered

Antwort: B

Begründung:
An endpoint detection and response (EDR) system is a security tool that monitors and analyzes the activities and behaviors of endpoints, such as computers, laptops, mobile devices, and servers. An EDR system can detect, prevent, and respond to various types of threats, such as malware, ransomware, phishing, and advanced persistent threats (APTs). One of the features of an EDR system is to block the automatic execution of downloaded programs, which can prevent malicious code from running on the endpoint when a user clicks on a link in a phishing message.
This can reduce the impact of a phishing attack and protect the endpoint from compromise.
Updating the EDR policies to block automatic execution of downloaded programs is a technical control that can mitigate the risk of phishing, regardless of the user's awareness or behavior.
Therefore, this is the best answer among the given options.
The other options are not as effective as updating the EDR policies, because they rely on administrative or physical controls that may not be sufficient to prevent or stop a phishing attack.
Placing posters around the office to raise awareness of common phishing activities is a physical control that can increase the user's knowledge of phishing, but it may not change their behavior or prevent them from clicking on a link in a phishing message.
Implementing email security filters to prevent phishing emails from being delivered is an administrative control that can reduce the exposure to phishing, but it may not be able to block all phishing emails, especially if they are crafted to bypass the filters. Creating additional training for users to recognize the signs of phishing attempts is an administrative control that can improve the user's skills of phishing detection, but it may not guarantee that they will always be vigilant or cautious when receiving an email. Therefore, these options are not the best answer for this question.

253. Frage

A small business uses kiosks on the sales floor to display product information for customers. A security team discovers the kiosks use end-of-life operating systems. Which of the following is the security team most likely to document as a security implication of the current architecture?

- A. Cost of replacement
- B. Product software compatibility
- C. Ease of recovery
- D. Patch availability

Antwort: D

Begründung:
End-of-life operating systems are those that are no longer supported by the vendor or manufacturer, meaning they do not receive any security updates or patches. This makes them vulnerable to exploits and attacks that take advantage of known or unknown flaws in the software. Patch availability is the security implication of using end-of-life operating systems, as it affects the ability to fix or prevent security issues. Other factors, such as product software compatibility, ease of recovery, or cost of replacement, are not directly related to security, but rather to functionality, availability, or budget.
