479. Frage

Which of the following should an organization focus on the most when making decisions about vulnerability prioritization?

- A. CVE
- B. Industry impact
- **C. CVSS**
- D. Exposure factor

Antwort: C

Begründung:

Detailed Explanation: The Common Vulnerability Scoring System (CVSS) is a standardized metric used to assess the severity of vulnerabilities, aiding organizations in prioritizing their response based on risk.

480. Frage

An employee clicked a link in an email from a payment website that asked the employee to update contact information. The employee entered the log-in information but received a "page not found" error message. Which of the following types of social engineering attacks occurred?

- A. Brand impersonation
- B. Pretexting
- **C. Phishing**
- D. Typosquatting

Antwort: C

Begründung:

Phishing is a type of social engineering attack that involves sending fraudulent emails that appear to be from legitimate sources, such

as payment websites, banks, or other trusted entities. The goal of phishing is to trick the recipients into clicking on malicious links, opening malicious attachments, or providing sensitive information, such as log-in credentials, personal data, or financial details. In this scenario, the employee received an email from a payment website that asked the employee to update contact information. The email contained a link that directed the employee to a fake website that mimicked the appearance of the real one. The employee entered the log-in information, but received a "page not found" error message. This indicates that the employee fell victim to a phishing attack, and the attacker may have captured the employee's credentials for the payment website.

481. Frage

Which of the following automation use cases would best enhance the security posture of an organization by rapidly updating permissions when employees leave a company?

- A. Escalating permission requests
- B. Reviewing change approvals
- C. Provisioning resources
- **D. Disabling access**

Antwort: D

Begründung:

Disabling access is an automation use case that would best enhance the security posture of an organization by rapidly updating permissions when employees leave a company. Disabling access is the process of revoking or suspending the access rights of a user account, such as login credentials, email, VPN, cloud services, etc.

Disabling access can prevent unauthorized or malicious use of the account by former employees or attackers who may have compromised the account. Disabling access can also reduce the attack surface and the risk of data breaches or leaks. Disabling access can be automated by using scripts, tools, or workflows that can trigger the action based on predefined events, such as employee termination, resignation, or transfer.

Automation can ensure that the access is disabled in a timely, consistent, and efficient manner, without relying on manual intervention or human error.
