New Talend-Core-Developer Mock Exam, Braindumps Talend-Core-Developer Pdf

As we all know, the latest Talend-Core-Developer quiz prep has been widely spread since we entered into a new computer era. The cruelty of the competition reflects that those who are ambitious to keep a foothold in the job market desire to get the Talend-

Core-Developer certification. As long as you spare one or two hours a day to study with our laTest Talend-Core-Developer Quiz prep, we assure that you will have a good command of the relevant knowledge before taking the exam. What you need to do is to follow the Talend-Core-Developer exam guide system at the pace you prefer as well as keep learning step by step.

Talend Core Certified Developer Exam Sample Questions (Q49-Q54):

NEW QUESTION # 49

Which actions can you perform in the configuration panel in Pipeline Designer? Choose 2 answers.

- A. Select the settings for a pipeline export.
- B. Preview changes made by processors.
- C. Modify processor values.
- D. Display and update dataset connections.

Answer: C,D

Explanation:

Comprehensive and Detailed Explanation:

In Talend Pipeline Designer, the configuration panel provides options for managing and modifying the settings of components within a pipeline.

* Modify processor values (Option A):

* Users can adjust values for processors such as filters, joins, transformations, and aggregations within the configuration panel.

* This helps fine-tune data processing rules directly in the pipeline.

* Display and update dataset connections (Option B):

* The configuration panel allows users to change dataset connections, updating the source or target locations of data.

* Users can modify database credentials, file paths, or API endpoints as needed.

Why not other options?

* Option C: The ability to preview changes made by processors is handled in the preview panel, not the configuration panel.

* Option D: Pipeline export settings are managed separately in the export settings menu, not in the configuration panel.

NEW QUESTION # 50

You need to set up a server in your Talend environment that enables several members of your team to collaborate on a project.

Which application must you enable before working on a remote project?

- A. Talent Administration Center instance must be running with the team members and project configured.
- B. Talend admission Center service must be running on each development workstation.
- C. Git or SVN client must be installed on each developed workstation.
- D. Git or SVN server instance must be running.

Answer: A,D

NEW QUESTION # 51

Which options can you use to add a Joblet to your talend Job?

Choose 3 answers

- A. Drag the Joblet from Palette to the design workspace.
- B. Drag the Jobket from the Repository tree view to designer canvas.
- C. Type the Joblet name on the Studio canvas, then select it from the Palette drop-down menu.
- D. Use a tRunJob component and select the Joblet from the drop-down menu.
- E. Right-click the Joblet from Palette and select the Add option.

Answer: A,B,C

Explanation:

To add a Joblet to your Talend Job, you can use one of these options:

* Type the Joblet name on the Studio canvas, then select it from the Palette drop-down menu. This will create a Joblet container on your canvas that contains all the components and links of your Joblet.

* Drag the Joblet from Repository tree view to designer canvas. This will also create a Joblet container on your canvas that contains all components and links of your Joblet.

* Drag Joblet from Palette to design workspace. This will open a dialog box where you can select an existing Joblet from Repository or create a new one.

You cannot use a tRunJob component and select Joblet from drop-down menu, nor right-click Joblet from Palette and select Add option. These methods are not available in Talend Studio and may cause errors or unexpected results. References: Talend Open Studio: Open-source ETL and Free Data Integration | Talend, [Joblets - 7.3]

NEW QUESTION # 52

In Talend Studio, you have access to a references project named project_ref. You need to reuse a Job named testJob from the project_ref in your main Job.

- A. Navigate to Metadata, @ project ref, Job Designs, Standard, then select testJob.
- B. Right-click Job Designs, click Create Standard Job, and enter testJob as the Job name.
- C. Right-click Job Designs and click import items.
- D. Navigate to @ Referenced project, @ project_ref, Job Designs, Standard, then select testJob.

Answer: D

Explanation:

To reuse a job named testJob from a referenced project named project_ref in your main job, you need to navigate to @Referenced project, @project_ref, Job Designs, Standard, then select testJob. A referenced project is a project that can be accessed from another project in read-only mode. You can add a referenced project to your main project by using the Project Settings window in Talend Studio. You can then browse the items (such as jobs, metadata, routines, etc.) of the referenced project in the Repository tree view under the

@Referenced project node. You can drag and drop any item from the referenced project to your main job design workspace.

You do not need to use import items, create standard job, or navigate to Metadata options. These options are not used to reuse jobs from referenced projects. The import items option is used to import items (such as jobs, metadata, routines, etc.) from an archive file that can be exported from another project or workspace. The create standard job option is used to create a new job with a name and a description. The Metadata node in the Repository tree view is used to store and manage metadata definitions for various data sources (such as databases, files, web services, etc.). References: Talend Open Studio: Open-source ETL and Free Data Integration | Talend, [Referenced projects - 7.3]

NEW QUESTION # 53

You are collaborating on a project with other developers using talend best practices.

When should you use a tag?

- A. Denoting major or minor releases.
- B. Denoting a milestone in the lifecycle of a project
- C. Fixing bugs or enhancements.
- D. Capturing snapshot of a codebase that requires ongoing maintenance.

Answer: B

Explanation:

Tags are used to mark specific points in the development lifecycle of a project. This can be done for a variety of reasons, such as:

* To mark the completion of a major feature or release

* To mark the start of a new development phase (e.g., QA, production)

* To mark a known good state of the codebase (e.g., before a risky change) Tags can be used to create branches, which can then be used to develop and test new features or bug fixes.

They can also be used to deploy the codebase to different environments (e.g., development, staging, production).

Examples of when to use a tag:

* When you are ready to release a new version of your application to production.

* When you have completed a major feature or milestone in the development of your application.

* Before making a risky change to your codebase, such as a database migration or refactoring.

* When you need to deploy your application to a different environment, such as staging or production.

Benefits of using tags:

* Tags can help you to keep track of the different versions of your codebase.

* Tags can help you to roll back to a previous version of your codebase if necessary.

* Tags can help you to deploy your codebase to different environments.

* Tags can help you to collaborate with other developers more effectively.

NEW QUESTION # 54

.....

We strongly advise you to buy our windows software of the Talend-Core-Developer study materials, which can simulate the real test environment. There is no doubt that you will never feel bored on learning our Talend-Core-Developer practice materials because of the smooth operation.
