During the trial period of our CAD study materials, the PDF versions of the sample questions are available for free download, and both the pc version and the online version can be illustrated clearly. You can contact us at any time if you have any difficulties in the purchase or trial process of our CAD Exam Dumps.

ServiceNow is a leading provider of cloud-based solutions that enable organizations to streamline their IT operations and improve their service delivery. ServiceNow offers a range of certifications to help professionals validate their knowledge and skills in using the platform. One of the most sought-after certifications is the Certified Application Developer (CAD) for ServiceNow.

ServiceNow Certified Application Developer-ServiceNow Sample Questions (Q114-Q119):

NEW QUESTION # 114

Which platform feature can be used to determine the relationships between field in an Import Set table to field in an existing ServiceNow table?

- A. CI Relationship Builder
- **B. Transform Map**
- C. Business Service Management Map
- D. Data Sources

Answer: B

Explanation:

A transform map determines the relationships between fields displaying in an Import Set table and fields in an existing ServiceNow table, such as the Incidents or Users table.

Reference:

The following platform feature can be used to determine the relationships between fields in an Import Set table to fields in an existing ServiceNow table:

Transform Map. This is a feature that defines the mapping between the fields of an Import Set table and the fields of a target table, such as incident, problem, or user. A transform map also specifies the logic and rules for transforming the imported data, such as coalescing, scripting, or applying data policies.

The following platform features are not used to determine the relationships between fields in an Import Set table to fields in an existing ServiceNow table:

Business Service Management Map. This is a feature that provides a graphical representation of the configuration items (CIs) and their relationships in the Configuration Management Database (CMDB). A Business Service Management Map can be used to visualize the impact of incidents, changes, or problems on the CIs and the services they support.

Data Sources. This is a feature that defines the connection and authentication information for an external data source, such as a file, a JDBC database, or a web service. A data source is used to import data from the external source into an Import Set table.

CI Relationship Builder. This is a feature that creates relationships between CIs in the CMDB based on predefined or custom rules. A CI Relationship Builder can be used to populate the CMDB with the dependencies and connections between the CIs. References: Transform Maps, Business Service Management Map, Data Sources, CI Relationship Builder

NEW QUESTION # 115

What occurs when an existing table is extended in ServiceNow?

- **A. The new table inherits the functionality built into the parent table.**
- B. The new table does not inherit any of the fields from the parent table.
- C. The table's Access Controls are ignored when determining access to the new table's records and fields.
- D. You must script and configure all required behaviors.

Answer: A

Explanation:

Table Extension in ServiceNow:

Extending a table in ServiceNow means creating a child table based on a parent table. The child table inherits the fields, configurations, and functionality of the parent table.

What is Inherited:

Fields: All fields from the parent table are available in the child table.

Functionality: The child table benefits from any business logic or workflows defined for the parent table.

Access Controls: The child table respects the Access Control rules defined for the parent table unless explicitly overridden.

Why Other Options Are Incorrect:

Option B: This is incorrect because the new table does inherit fields from the parent table.

Option C: This is incorrect because you do not need to script or configure behaviors from scratch; they are inherited.

Option D: This is incorrect because Access Controls are not ignored; they still apply and can be extended or modified for the child table.

Reference:

ServiceNow Developer Documentation on Table Inheritance.

NEW QUESTION # 116

Application developers can specify which ServiceNow page a user sees after submitting a new record using the Record Producer UI. How is the page specified?

- **A. Create an application property to store the URL**
- B. Write an after Business Rule script for the Record Producer's table: window.redirect = "<URL>";
- C. Configure the page in the Module that opens the Record Producer UI
- D. Write a script in the Record Producer's Script field: producer.redirect = "<URL>";

Answer: A

Explanation:

Application developers can specify which ServiceNow page a user sees after submitting a new record using the Record Producer UI by writing a script in the Record Producer's Script field: producer.redirect =

"<URL>";. This script sets the redirect property of the producer object to the URL of the desired page. For example, producer.redirect = "home.do"; will redirect the user to the homepage after submitting the record. The other options are not valid ways to specify the redirect page for a Record Producer. Reference: Populate record producer data and redirect users

NEW QUESTION # 117

Which statement correctly describes the differences between a Client Script and a Business Rule?

- **A. A Client Script! executes on the client and a Business Rule executes on the server**
- B. A Client Script executes on the server and a Business Rule executes on the client
- C. A Client Script executes before a record is loaded and a Business Rule executes after a record is loaded
- D. A Client Script executes before a record is loaded and a Business Rule executes after a record is updated

Answer: A

NEW QUESTION # 118

How does ServiceNow match inbound email to existing records?

- A. sys_id
- **B. Watermark**
- C. Subject line
- D. Record link

Answer: B

Explanation:

https://developer.servicenow.com/dev.do#!/learn/courses/tokyo/app_store_learnv2_flowdesigner_tokyo_flow_de
"By default, the system generates a watermark label at the bottom of each notification email to allow matching incoming email to existing records." https://docs.servicenow.com/bundle/tokyo-servicenow-platform/page/administer/notification/concept/c_
