Have you ever noticed that people who prepare themselves for SolarWinds SCP-NPM certification exam do not need to negotiate their salaries for a higher level, they just get it after they are SolarWinds SCP-NPM Certified? The reason behind this fact is that they are considered the most deserving candidates for that particular job.

The SCP-NPM Certification Exam is designed for IT professionals who have experience with network performance monitoring and management. It is ideal for network administrators, network engineers, and IT managers who are responsible for managing and maintaining complex networks. To obtain this certification, candidates must pass a rigorous exam that tests their knowledge and skills in using the NPM tool to monitor and manage network performance.

Free PDF Quiz 2025 SCP-NPM: SolarWinds Network Performance Monitor (NPM) Exam Useful Test Question

Advancement in SCP-NPM information and communications technology generates huge potential for moving business and production up the value-chain, and improving the quality of life of citizens. And there is no doubt that you can get all kinds of information in cyber space now, SCP-NPM latest torrent is not an exception. I strongly recommend the SCP-NPM Study Materials compiled by our company for you, the advantages of our SCP-NPM exam questions are too many to enumerate. And if you have a try on our SCP-NPM exam questions, you will love to buy it.

SolarWinds SCP-NPM Exam Syllabus Topics:

Topic	Details
Topic 1	• User Interface: This section explains how navigation and customization of the Orion Web Console happen including adding logos and customizing menu bars.

Topic 2	Agents: This section explains agents and how to monitor devices with Orion agents, deploy agents on Windows and Linux systems, and use the Add Node Wizard for agent deployment.
Topic 3	Custom Polling: This section explains the Universal Device Poller (UnDP) feature, how to monitor custom statistics based on MIBs and OIDs, define custom statistics, and transform poller results.
Topic 4	Maps: This part of the exam explains custom views and maps in NPM, creating Network Atlas maps, adding maps to NPM, and creating wireless heat maps.
Topic 5	User Management: In this section, the focus is on user account creation, management, and permissions in SolarWinds NPM.
Topic 6	Administration & Troubleshooting: This particular section of the exam covers troubleshooting with Performance Analysis dashboards, using alerts to monitor the environment, High Availability in SolarWinds products, and troubleshooting agent installation and deployment.

SolarWinds Network Performance Monitor (NPM) Exam Sample Questions (Q70-Q75):

NEW QUESTION # 70

The Orion platform supports agent-based monitoring for which OS types? (Choose all that apply.)

- A. Windows
- B. Sun Solaris
- C. IBM
- D. Linux
- E. AIX Unix Agents

Answer: A,D,E

Explanation:

The Orion platform supports agent-based monitoring for Windows, Linux/Unix, and AIX systems. An Orion agent is software that provides a communication channel between the Orion server and the target system, as an alternative to WMI or SNMP. Agent-based monitoring can offer better performance, security, and reliability than agentless monitoring, especially for remote or cloud-based systems. The Orion platform does not support agent-based monitoring for Sun Solaris or IBM systems, as they are not compatible with the agent software. NEW QUESTION # 71

What is required of your nodes to detect duplex mismatches? (Choose all that apply.)

- A. Ensure corresponding values for each interface are different
- B. Duplex of both devices must be identified as full or half
- C. Unify the duplex mode configuration on neighboring interfaces
- D. The nodes must support topology and be interconnected

Answer: B,C,D

Explanation:

To detect duplex mismatches, you need to meet the following requirements1:

The nodes must be monitored by NPM.

The nodes must be in the up state during the discovery.

The nodes must support topology and be interconnected.

Duplex of both devices must be identified as full or half.

The Possible Duplex Mismatches widget must be enabled on the node details view.

You do not need to ensure corresponding values for each interface are different, as this is the result of a duplex mismatch, not a requirement for detection. In fact, you should unify the duplex mode configuration on neighboring interfaces to avoid mismatches1.

NEW QUESTION # 72

Your network has critical devices on the opposite side of a WAN link from your SolarWinds server. You do not want alerts about the devices if the router (name = "target") that connects your SolarWinds server to the remote site is down. How do you configure Alert Suppression?

- A. Suppress alert when any of the following apply: Node Name is equal to "target" / Node Status is equal to "Warning"
- B. Suppress alert when all of the following apply: Node Name is equal to "target" / Interface Status is equal to "Warning"
- C. Suppress alert when any of the following apply: Node Name is equal to "target" / Interface Status is equal to "Down"
- **D. Suppress alert when all of the following apply: Node Name is equal to "target" / Node Status is equal to "Down"**

Answer: D

Explanation:

Alert suppression is a feature that allows you to create conditions that prevent an alert from being triggered or sent if certain criteria are met. This can help you avoid receiving multiple or unnecessary alerts from a single event or a complex situation. For example, if you have a router that connects your SolarWinds server to a remote site with critical devices, you may not want to receive alerts about those devices if the router is down, as the problem is not with the devices but with the router. In this case, you can configure alert suppression to suppress the alerts for the devices if the router is down. To do this, you need to select the option "Suppress the alert if all of the following apply" and add the conditions "Node Name is equal to 'target'" and "Node Status is equal to 'Down'". This means that the alert will be suppressed only if both conditions are true, i.e., the router with the name 'target' is down. If the router is up or has a different name, the alert will not be suppressed. Reference: Alert suppression - SolarWinds; Alert Suppression - Forum - Network Performance Monitor (NPM) - THWACK

NEW QUESTION # 73

Which is not true for Device Studio Poller?

- A. Collects data from Orion Failover Engine or Hot Standby Engines
- B. Can perform logical operations or transformations on the polled data
- **C. Polled values are displayed in existing resources**
- D. Can poll multiple OIDs for a given technology

Answer: C

NEW QUESTION # 74

Status, Average Response Time, and Packet Loss are the only node details data you can view for your switch A device. The node details of your identical switch B device show Status, Average Response Time, and Packet Loss and other statistics. How can you monitor the other statistics on switch A and not lose any historical data?

- A. Edit the node properties of switch B and change the polling method to "Status Only: ICMP"
- B. Delete switch A, and then add it again and this time choose "Most Devices: SNMP and ICMP" as the polling method
- **C. Add switch A again without deleting it first, and this time choose "Most Devices: SNMP and ICMP" as the polling method**
- D. Edit the node properties of switch A and change the polling method to "Most Devices: SNMP and ICMP"
- E. Edit the node properties of switch A and change the polling method to "Status Only: ICMP"

Answer: C
