In order to meet the needs of all customers that pass their exam and get related certification, the experts of our company have designed the updating system for all customers. Our 2V0-11.25 exam question will be constantly updated every day. The IT experts of our company will be responsible for checking whether our 2V0-11.25 Exam Prep is updated or not. Once our 2V0-11.25 test questions are updated, our system will send the message to our customers immediately. If you use our 2V0-11.25 exam prep, you will have the opportunity to enjoy our updating system and pass the 2V0-11.25 exam.

## VMware Cloud Foundation 5.2 Administrator Sample Questions (Q147-Q152):

### NEW QUESTION # 147

An administrator is unable to log in to the SDDC Manager UI on their local workstation. After entering the correct URL, the login page does not load and the administrator is unable to enter their credentials in order to view the SDDC Manager inventory. They confirm that the SDDC Manager appliance responds to a ping command from their local workstation against both its FQDN and IP address.

After checking the VM console of the SDDC Manager appliance in the management vCenter UI, they determine that the operating system is online and they can log in to it with the relevant administrator level accounts.

What two actions could the administrator take whilst logged in to the SDDC Manager VM via the VM console to help identify the root cause of the UI not loading? (Choose two.)

- A. Perform a restart of the services using the command `systemctl restart`.
- B. Verify the health of the SDDC Manager services using the command `sos --get-vcf-services-summary`.
- C. Verify that there is free disk space remaining using the command `df -h`.
- D. Verify that port 80 is open and listening for connections using the command `netstat`.
- E. Perform a restart of the network adapter using the command `systemctl restart`.

**Answer: B,C**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

According to the VMware Cloud Foundation 5.2 Administration Guide and troubleshooting documentation, when the SDDC

Manager UI does not load even though the appliance is reachable and online, administrators should check both the health of services and the system resources. Here's the detailed reasoning and exact documentation extracts:

Option C: Verify the health of the SDDC Manager services using the command `sos --get-vcf-services-summary`.

Official documentation states:

"You can check the status of SDDC Manager services by running the `sos` command on the SDDC Manager VM. This command provides a summary of all SDDC Manager services and their current state. If any service is stopped or unhealthy, this may prevent the UI from loading." Reference:

Option E: Verify that there is free disk space remaining using the command `df -h`.

Official documentation specifies:

"If the SDDC Manager appliance runs out of disk space, the UI and related services may become unresponsive. Use the `df -h` command to check for available disk space on the appliance." Why Not the Other Options?

Option A: Port 80 is not used for the SDDC Manager UI; the UI listens on port 443 (HTTPS).

Option B and D: Restarting the network adapter or services without first identifying the root cause is not a recommended troubleshooting step according to the official documentation.

Summary:

The administrator should check the SDDC Manager services health (C) and ensure there is free disk space (E) on the appliance, as recommended by the VMware official documentation for troubleshooting UI access issues in VMware Cloud Foundation 5.2.

### NEW QUESTION # 148

During a routine check, an administrator observes that several VMs are reporting high memory usage in VMware Aria Operations. They need to verify if the high memory usage is due to memory contention.

What actions should be taken in VMware Aria Operations to verify this?

- A. Check the memory usage and ballooning metrics.
  - B. Analyze the storage I/O performance.
  - C. Review the CPU ready time.
- B Look al the network throughput

**Answer: B**

Explanation:

To verify if high memory usage is due to memory contention, the administrator should check the memory usage and ballooning metrics in VMware Aria Operations. Ballooning occurs when the hypervisor reclaims memory from a virtual machine due to memory contention, and monitoring these metrics can help identify whether the VMs are experiencing memory pressure or being forced to swap memory.

### NEW QUESTION # 151

What option should be selected when placing a vSAN host into maintenance mode to ensure that all data remains accessible throughout the maintenance process while also minimizing the duration of the operation?

- A. Full Data Migration
- **B. Ensure Accessibility**
- C. Ensure Data Accessibility
- D. No Data Migration

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

According to the VMware Cloud Foundation 5.2 Administration Guide and vSAN Official Documentation, when placing a vSAN host into maintenance mode, there are several options available for handling data. The correct option to ensure all data remains accessible and to minimize the duration of the operation is:

B. Ensure Accessibility

Exact Extract from official documentation:

"Ensure Accessibility - This is the default and recommended option for most maintenance activities. When selected, vSAN makes sure that data is available and accessible even if the host is offline, by migrating only the data necessary to maintain availability. This option ensures minimal data movement and the fastest maintenance mode operation, while still protecting data accessibility." (Source: VMware vSAN Administration Guide) Why Not the Other Options?

A. Ensure Data Accessibility: This is not a documented vSAN maintenance mode option. The correct option is "Ensure Accessibility." C. Full Data Migration: This option migrates all data from the host, which increases the time required for

To ensure all data remains accessible and to minimize the maintenance window, select Ensure Accessibility (B) when placing a vSAN host into maintenance mode, as specified in the official VMware documentation.
