XK0-005 Valid Test Pdf | XK0-005 Test Dumps

The CompTIA XK0-005 exam is necessary for you if you want to improve your professional career. CompTIA XK0-005 exam questions changes from time to time so, it is important to check for updates regularly otherwise you can miss an important thing in the middle of your CompTIA XK0-005 Questions preparation. After the purchase, you will get XK0-005 dumps' latest updates for up to 90 days as soon as they are available. If the DumpTorrent introduces new updates to XK0-005 study material within 90 days of your purchase then you will get them free of cost.

CompTIA Linux+ Certification Exam Sample Questions (Q208-Q213):

NEW QUESTION # 208

A Linux administrator found many containers in an exited state. Which of the following commands will allow the administrator to

clean up the containers in an exited state?

- A. docker rm -- all
- B. docker images prune *
- C. docker rm \$(docker ps -aq)
- D. docker rm -- state exited

Answer: C

Explanation:

Explanation

This command will remove all containers, regardless of their state, by passing the IDs of all containers to the docker rm command. The docker ps -aq command will list the IDs of all containers, including the ones in an exited state, and the \$ () syntax will substitute the output of the command as an argument for the docker rm command. This is a quick and easy way to clean up all containers, but it may also remove containers that are still needed or running.

References

docker rm | Docker Docs - Docker Documentation, section "Remove all containers" Docker Remove Exited Containers | Easy methods. - Bobcares, section "For removing all exited containers"

NEW QUESTION # 209

A DevOps engineer wants to work on a snapshot of the infrastructure as code configuration. Which of the following commands should the engineer use to accomplish this task?

- A. git pull <feature>
- B. git tag <feature>
- C. git push <feature>
- D. git branch <feature>

Answer: B

Explanation:

Creating a snapshot of the current state of the code in Git is best achieved with the git tag <feature> command, which is often used to mark release points or stable versions in a project. Tags are helpful for referencing points in history without affecting the branch structure. Unlike branches, which are for active development, tags are commonly used to mark versions for future reference or deployment. Reference: CompTIA Linux+ Study Guide.

NEW QUESTION # 210

A Linux user reported the following error after trying to connect to the system remotely:

ssh: connect to host 10.0.1.10 port 22: Resource temporarily unavailable The Linux systems administrator executed the following commands in the Linux system while trying to diagnose this issue:

```
# netstat -an | grep 22 | grep LISTEN
tcp        0      0  0.0.0.0:22          0.0.0.0:*          LISTEN

# firewall-cmd --list-all
public (active)
  target: default
  icmp-block-inversion: no
  interfaces: eth0
  sources:
  services: dhcpv6-client
  ports:
  protocols:
  masquerade: no
    forward-ports:
    source-ports:
  icmp-blocks:
  rich rules:
```

Which of the following commands will resolve this issue?

- A. `firewall-cmd --zone=public --permanent --add-port=22/udp`
- B. `firewall-cmd --zone=public --permanent --add-service=22`
- **C. `firewall-cmd --zone=public --permanent --add-service=ssh`**
- D. `systemctl enable firewalld; systemctl restart firewalld`

Answer: C

Explanation:

The `firewall-cmd --zone=public --permanent --add-service=ssh` command will resolve the issue by allowing SSH connections on port 22 in the public zone of the firewalld service. This command will add the ssh service to the permanent configuration of the public zone, which means it will persist after a reboot or a reload of the firewalld service. The `firewall-cmd --zone=public --permanent --add-service=22` command is invalid, as 22 is not a valid service name. The `systemctl enable firewalld; systemctl restart firewalld` command will enable and restart the firewalld service, but it will not change the firewall rules. The `firewall-cmd --zone=public --permanent --add-port=22/udp` command will allow UDP traffic on port 22 in the public zone, but SSH uses TCP, not UDP.

NEW QUESTION # 211

A systems administrator is receiving tickets from users who cannot reach the application app that should be listening on port 9443/tcp on a Linux server.

To troubleshoot the issue, the systems administrator runs `netstat` and receives the following output:

```
# netstat -anp | grep appd | grep -w LISTEN
tcp 0 0 127.0.0.1:9443 0.0.0.0:* LISTEN 1234/appd
```

Based on the information above, which of the following is causing the issue?

- A. The application is listening on port 1234.
- **B. The application is listening on the loopback interface.**
- C. The application is not running.
- D. The IP address 0.0.0.0 is not valid.

Answer: B

Explanation:

The server is in a "Listen" state on port 9443 using its loopback address. The "1234" is a process-id. The cause of the issue is that the application is listening on the loopback interface. The loopback interface is a virtual network interface that is used for internal communication within the system. The loopback interface has the IP address 127.0.0.1, which is also known as localhost. The `netstat` output shows that the application is listening on port 9443 using the IP address 127.0.0.1. This means that the application can only accept connections from the same system, not from other systems on the network. This can prevent the users from reaching the application and cause the issue. The administrator should configure the application to listen on the IP address 0.0.0.0, which means all available interfaces, or on the specific IP address of the system that is reachable from the network. This will allow the application to accept connections from other systems and resolve the issue. The cause of the issue is that the application is listening on the loopback interface. This is the correct answer to the question. The other options are incorrect because they are not supported by the outputs. The IP address 0.0.0.0 is valid and means all interfaces, the application is not listening on port 1234, and the application is running as shown by the process ID 1234. References: CompTIA Linux+ (XK0-005) Certification Study Guide, Chapter 12: Managing Network Connections, page 383.

NEW QUESTION # 212

An administrator wants to add a user named `comptia` to the system administrators group. Which of the following commands will accomplish this task?

- A. `sudo -sG wheel comptia`
- B. `Usermod *sG wheel comptia`
- **C. `Useradd -sG wheel comptia`**
- D. `visudo -sG wheel comptia`

Answer: C

NEW QUESTION # 213
