You can use host firmware packages by defining a host firmware policy as an attribute of a service profile template, which is an
updating template. Any change made to the service profile template is automatically made to its instantiated service profiles.
Subsequently, the servers associated with the service profiles are also upgraded in parallel with the firmware version.

The Cisco UCS domains are categorized into domain groups in Cisco UCS Central for management
purposes. You can manage firmware for each domain group separately at the domain group level or for
all domain groups from the domain group root. Cisco UCS Central provides you the option to manage
the following Cisco UCS domain firmware packages:

- **Capability Catalog**– One capability catalog per domain group. All Cisco UCS domains registered to
  a particular domain group will use the capability catalog defined in the domain group.

- **Infrastructure Firmware**– One infrastructure firmware policy per domain group . All Cisco UCS
  domains registered to a particular domain group will use the same Infrastructure firmware version
  defined in the domain group.

- **Host Firmware**– You can have more than one host firmware policy for the different host firmware
  components in a domain group. The Cisco UCS domains registered in the domain group will be able
  to choose any defined host firmware policy in the group. Cisco UCS Central provides you the option
  to upgrade the host firmware globally to all Cisco UCS domains in a domain group at the same time.

Note   For more information on managing firmware in Cisco UCS Central, see the Firmware
Management chapters in the *Cisco UCS Central Administration Guide* and *Cisco UCS Central
CLI Reference Manual.*
