- D. Set the input JSON Path as Contact and the OutPut JSON Path as List (Contact)

Answer: B,C

A DataRaptor Transform can be used to transform data from one format to another, such as JSON, XML, or CSV. The developer can specify the input and output paths for each field in the Transform tab. The developer can also use formulas to manipulate data in the Formula tab1. To transform contact data into a JSON array, the developer can use either of these methods:

Use a formula LIST(Contact), and add the output of the formula as the input in the Transform tab. This will create a list of contact objects from the input JSON and output it as a JSON array.

Set the Input JSON Path as Contact, the Output JSON Path as Contact, and the Output Data Type as List. This will output each contact object as an element of a JSON array.

- C. In a Remote Action in an Additional Output value field

* C. In a Data Mapper Action in an Input Parameters value field - Correct. Input Parameters to DataRaptors in Integration Procedures can use expression logic to dynamically compute and pass values.

Incorrect Options:

* A. Output JSON Path in DataRaptor is for structural mapping, not function execution.
* D. Remote Action Output fields typically receive data, not compute it.
