What's more, part of that PDFBraindumps MuleSoft-Integration-Associate dumps now are free: [https://drive.google.com/open?id=1tOCrW55\\_MY5EOFTeWaFQfLOhocVJEDbi](https://drive.google.com/open?id=1tOCrW55_MY5EOFTeWaFQfLOhocVJEDbi)

As the professional provider of exam related materials in IT certification test, PDFBraindumps has been devoted to provide all candidates with the most excellent questions and answers and has helped countless people pass the exam. PDFBraindumps Salesforce MuleSoft-Integration-Associate study guide can make you gain confidence and help you take the test with ease. You can pass MuleSoft-Integration-Associate Certification test on a moment's notice by PDFBraindumps exam dumps. Isn't it amazing? But it is true. As long as you use our products, PDFBraindumps will let you see a miracle.

When preparing for the test MuleSoft-Integration-Associate certification, most clients choose our products because our MuleSoft-Integration-Associate learning file enjoys high reputation and boost high passing rate. Our products are the masterpiece of our company and designed especially for the certification. Our MuleSoft-Integration-Associate latest study question has gone through strict analysis and verification by the industry experts and senior published authors. The clients trust our products and treat our products as the first choice. So the total amounts of the clients and the sales volume of our MuleSoft-Integration-Associate learning file is constantly increasing.

### NEW QUESTION # 26

A Kubernetes controller automatically adds another pod replica to the resource pool in response to increased application load. Which scalability option is the controller implementing?

- A. Down
- B. Horizontal

- C. Diagonal
- D. Vertical

**Answer: B**

Explanation:

Kubernetes offers several scalability options to handle varying application loads. The scenario described involves adding another pod replica in response to increased load, which is a form of horizontal scaling. Here's a detailed explanation:

\* Horizontal Scaling:

\* Definition: Horizontal scaling, also known as scaling out, involves adding more instances (pods) to distribute the load and increase capacity.

\* Implementation in Kubernetes: Kubernetes uses controllers like the Horizontal Pod Autoscaler (HPA) to automatically adjust the number of pod replicas based on observed CPU utilization or other select metrics.

\* Benefits:

\* Load Distribution: By adding more pod replicas, the load is evenly distributed, reducing the risk of any single pod being overwhelmed.

\* Fault Tolerance: Horizontal scaling enhances fault tolerance and availability, as multiple pod replicas can handle requests if one fails.

\* Automatic Scaling:

\* Kubernetes Controller: The HPA continuously monitors the application load and adjusts the number of pod replicas accordingly, ensuring optimal performance.

**NEW QUESTION # 27**

A key CI/CD capability of any enterprise solution is a testing framework to write and run repeatable tests. Which component of Anypoint Platform provides the test automation capabilities for customers to use in their pipelines?

- A. Mule Maven Plugin
- B. Exchange Mocking Service
- C. Anypoint CLI
- D. MUnit

**Answer: D**

Explanation:

A robust CI/CD pipeline requires automated testing to ensure code quality and functionality. MuleSoft's MUnit provides this capability for Mule applications. Here's a detailed explanation:

\* MUnit:

\* Purpose: MUnit is MuleSoft's testing framework for creating automated tests for Mule applications.

\* Capabilities:

\* Unit Tests: Write unit tests to validate the behavior of individual components and flows.

\* Integration Tests: Test interactions between multiple components and external systems.

\* CI/CD Integration:

\* Automation: Integrate MUnit tests into CI/CD pipelines using tools like Jenkins, GitLab CI, or Bamboo.

\* Repeatable Tests: Ensures that tests are executed consistently with each code change, catching issues early in the development process.

\* Pipeline Execution:

\* Build and Test: The pipeline automatically runs MUnit tests during the build process, providing immediate feedback on the code changes.

\* Quality Assurance: Helps maintain high code quality and reduces the risk of defects in production.

**NEW QUESTION # 28**

According to MuleSoft, what is a major distinguishing characteristic of an application network in relation to the integration of systems, data, and devices?

- A. It is built for change and self-service
- B. It uses CI/CD automation for real-time project delivery
- C. It uses a well-organized monolithic approach with standards
- D. It leverages well-accepted internet standards like HTTP and JSON

**Answer: A**

Explanation:

An application network, as envisioned by MuleSoft, is designed to be dynamic and self-service, enabling rapid adaptation to changing business needs. Here's a detailed explanation:

\* Built for Change:

\* Flexibility: An application network allows for the easy addition, modification, and removal of services without disrupting existing functionalities.

\* Modular Architecture: Promotes a modular approach where services and APIs can be independently developed, deployed, and managed.

\* Self-Service:

\* Empowerment: Enables different teams (e.g., developers, business units) to access and use APIs and services without heavy reliance on central IT.

\* API-led Connectivity: Facilitates a self-service model where reusable APIs are available for various teams to integrate and build upon, accelerating innovation and reducing time-to-market.

\* Characteristics:

\* Decentralization: Unlike monolithic architectures, an application network supports decentralized development and deployment.

\* Reusability and Discoverability: Services and APIs are designed to be easily discoverable and reusable across different parts of the organization.

**NEW QUESTION # 29**

A system administrator needs to determine when permissions were last changed for an Anypoint Platform user.

Which Anypoint Platform component should the administrator use to obtain this information?

- A. Anypoint Monitoring
- B. Anypoint Studio
- C. Mule Stack Traces
- D. Audit Logging

**Answer: D**

Explanation:

Anypoint Platform provides various tools and components for managing and monitoring the platform and its activities. To determine when permissions were last changed for an Anypoint Platform user, Audit Logging is the appropriate component to use. Here's a detailed explanation:

\* Audit Logging:

\* Purpose: Audit logs capture detailed records of user activities and changes within the Anypoint Platform, including permission changes.

\* Access: Administrators can access audit logs through the Anypoint Platform's management console.

\* Information Captured:

\* User Actions: Logs include information about user logins, permission changes, API deployments, and other critical actions.

\* Timestamp: Each log entry is timestamped, providing the exact time and date when the permissions were changed.

\* Use Case:

\* Monitoring and Security: Audit logs are crucial for monitoring platform activities, ensuring compliance, and investigating security incidents.

**NEW QUESTION # 30**

An IT integration team followed an API-led connectivity approach to implement an order-fulfillment business process. It created an

order processing API that coordinates stateful interactions with a variety of microservices that validate, create and fulfill new product orders.

Which interaction composition pattern did the integration architect who designed this order processing API use?

- A. Aggregation
- **B. Orchestration**
- C. Streaming
- D. Multicasting

**Answer: B**

Explanation:

In an API-led connectivity approach, different APIs are layered to provide modular and reusable services. For an order processing API that coordinates stateful interactions with various microservices, the integration architect used the orchestration interaction composition pattern. Here's a step-by-step explanation:

\* Understanding Orchestration:

\* Definition: Orchestration involves coordinating multiple services to achieve a complex business workflow. Unlike choreography, which relies on each service knowing its part, orchestration uses a central controller to manage the interactions.

\* Role of the Orchestrator: The orchestrator manages the execution sequence, handles the state, and ensures all the necessary steps are completed successfully.

\* Order Processing API:

\* API-Led Connectivity: An order processing API, following API-led connectivity, sits in the Process layer, handling complex business processes and logic.

\* Stateful Interactions: Orchestration is particularly suitable for stateful interactions where the process needs to remember the state between steps, such as validating an order, creating it, and fulfilling it.

\* Implementation Steps:

\* Microservices Interaction: The order processing API interacts with various microservices:

\* Validation Microservice: Checks the validity of the order details.

\* Creation Microservice: Creates the order in the system.

\* Fulfillment Microservice: Manages the order fulfillment process.

\* Coordination: The API orchestrates these steps, ensuring each one completes successfully before moving to the next, handling exceptions, and maintaining the state of the process.
