

Trustworthy ANS-C01 Pdf, New ANS-C01 Test Testking

BTW, DOWNLOAD part of Free4Dump ANS-C01 dumps from Cloud Storage: <https://drive.google.com/open?id=1RQW2HcpLyf9DJWo0YK0jbiV3RUSp8bc1>

So rest assured that with the Free4Dump AWS Certified Advanced Networking Specialty Exam (ANS-C01) practice questions, you will not only make the entire Amazon ANS-C01 exam dumps preparation process and enable you to perform well in the final AWS Certified Advanced Networking Specialty Exam (ANS-C01) certification exam with good scores. To provide you with the updated ANS-C01 Exam Questions the Free4Dump offers three months updated AWS Certified Advanced Networking Specialty Exam (ANS-C01) exam dumps download facility, Now you can download our updated ANS-C01 practice questions up to three months from the date of Free4Dump AWS Certified Advanced Networking Specialty Exam (ANS-C01) exam purchase.

Amazon ANS-C01 (AWS Certified Advanced Networking Specialty) Certification Exam is a challenging and rewarding certification for IT professionals who want to specialize in advanced networking solutions on the AWS platform. It validates the skills and knowledge required to design and implement complex networking architectures on AWS and can open up new career opportunities and higher salaries.

Free4Dump's ANS-C01 Dumps Questions With 365 Days Free Updates

One of the main unique qualities of the Free4Dump Amazon Exam Questions is its ease of use. Our practice exam simulators are user and beginner friendly. You can use AWS Certified Advanced Networking Specialty Exam (ANS-C01) PDF dumps and Web-based software without installation. AWS Certified Advanced Networking Specialty Exam (ANS-C01) PDF questions work on all the devices like smartphones, Macs, tablets, Windows, etc. We know that it is hard to stay and study for the AWS Certified Advanced Networking Specialty Exam (ANS-C01) exam dumps in one place for a long time.

The ANS-C01 certification is a valuable credential for IT professionals who work with AWS and are looking to advance their careers in this field. AWS Certified Advanced Networking Specialty Exam certification demonstrates a high level of skill and expertise in advanced networking, which can help individuals stand out in a competitive job market and increase their earning potential.

The AWS Certified Advanced Networking Specialty certification exam is intended for individuals who have already earned an AWS Certified Cloud Practitioner or Associate-level certification. ANS-C01 Exam Tests candidates on their ability to design and

implement advanced networking solutions in AWS, including network optimization, troubleshooting, and security. ANS-C01 exam also covers topics such as Amazon Virtual Private Cloud (VPC), Direct Connect, AWS Transit Gateway, and AWS VPN.

Amazon AWS Certified Advanced Networking Specialty Exam Sample Questions (Q63-Q68):

NEW QUESTION # 63

A company has developed an application on AWS that will track inventory levels of vending machines and initiate the restocking process automatically. The company plans to integrate this application with vending machines and deploy the vending machines in several markets around the world. The application resides in a VPC in the us-east-1 Region. The application consists of an Amazon Elastic Container Service (Amazon ECS) cluster behind an Application Load Balancer (ALB). The communication from the vending machines to the application happens over HTTPS.

The company is planning to use an AWS Global Accelerator accelerator and configure static IP addresses of the accelerator in the vending machines for application endpoint access. The application must be accessible only through the accelerator and not through a direct connection over the internet to the ALB endpoint.

Which solution will meet these requirements?

- A. Configure the ALB in a public subnet of the VPC. Attach an internet gateway. Add routes in the subnet route tables to point to the internet gateway. Configure the accelerator with endpoint groups that include the ALB endpoint. Configure the ALB's security group to only allow inbound traffic from the accelerator's IP addresses on the ALB listener port.
- B. Configure the ALB in a private subnet of the VPC. Attach an internet gateway. Add routes in the subnet route tables to point to the internet gateway. Configure the accelerator with endpoint groups that include the ALB endpoint. Configure the ALB's security group to only allow inbound traffic from the accelerator's IP addresses on the ALB listener port.
- C. Configure the ALB in a private subnet of the VPC. Configure the accelerator with endpoint groups that include the ALB endpoint. Configure the ALB's security group to only allow inbound traffic from the internet on the ALB listener port.
- **D. Configure the ALB in a private subnet of the VPC. Attach an internet gateway without adding routes in the subnet route tables to point to the internet gateway. Configure the accelerator with endpoint groups that include the ALB endpoint. Configure the ALB's security group to only allow inbound traffic from the internet on the ALB listener port.**

Answer: D

Explanation:

Please read the below link typically describing ELB integration with AWS Global accelerator (and the last line of the extract) -

<https://docs.aws.amazon.com/global-accelerator/latest/dg/secure-vpc-connections.html> "When you add an internal Application Load Balancer or an Amazon EC2 instance endpoint in AWS Global Accelerator, you enable internet traffic to flow directly to and from the endpoint in Virtual Private Clouds (VPCs) by targeting it in a private subnet. The VPC that contains the load balancer or EC2 instance must have an internet gateway attached to it, to indicate that the VPC accepts internet traffic. However, you don't need public IP addresses on the load balancer or EC2 instance. You also don't need an associated internet gateway route for the subnet."

NEW QUESTION # 64

A company's AWS infrastructure is spread across more than 50 accounts and across five AWS Regions. The company needs to manage its security posture with simplified administration and maintenance for all the AWS accounts. The company wants to use AWS Firewall Manager to manage the firewall rules and requirements.

The company creates an organization with all features enabled in AWS Organizations.

Which combination of steps should the company take next to meet the requirements? (Select THREE.)

- **A. Set an account as the Firewall Manager administrator account.**
- B. Configure only the Firewall Manager administrator account to join the organization.
- **C. Configure all the accounts to join the organization.**
- **D. Set up AWS Config for all the accounts and all the Regions where the company has resources.**
- E. Set an account as the Firewall Manager child account.
- F. Set up AWS Config for only the organization's management account.

Answer: A,C,D

NEW QUESTION # 65

You have created a centralized, shared service Virtual Private Cloud (VPC) for your organization. It uses VPC peering, and you have been asked to evaluate AWS PrivateLink to optimize connectivity. Which of the following design considerations is true?

Response:

- A. Applications that require the source IP address will have access to the source IP through AWS PrivateLink.
- B. AWS PrivateLink will increase the overall performance capability of the shared services by using a Network Load Balancer.
- C. The scalability of VPC peering is higher for high-bandwidth applications. This allows for faster transfers and more spoke VPCs.
- **D. AWS PrivateLink is only appropriate for solutions that originate requests to the services VPC. Services in the shared VPC cannot initiate connections to spoke VPCs**

Answer: D

NEW QUESTION # 66

What service is used to store the log files generated by CloudTrail?

Response:

- **A. S3**
- B. EBS
- C. EC2
- D. VPC

Answer: A

NEW QUESTION # 67

A company hosts its ecommerce application on Amazon EC2 instances behind an Application Load Balancer. The EC2 instances are in a private subnet with the default DHCP options set. Internet connectivity is through a NAT gateway that is configured in the public subnet.

A third-party audit of the security infrastructure identifies a DNS exfiltration vulnerability. The company must implement a highly available solution that protects against this vulnerability.

Which solution will meet these requirements MOST cost-effectively?

Response:

- A. Use AWS Network Firewall with domain name filtering.
- **B. Use Amazon Route 53 Resolver DNS Firewall. Configure a domain list with a rule group.**
- C. Configure an Amazon Route 53 Resolver outbound endpoint with rules to filter and block suspicious traffic.
- D. Configure a BIND server with DNS filtering. Modify the DNS servers in the DHCP options set.

Answer: B
