Amazon AWS Certified DevOps Engineer - Professional Sample Questions (Q459-Q464):

NEW QUESTION # 459

A web application for healthcare services runs on Amazon EC2 instances behind an ELB Application Load Balancer. The instances run in an Amazon EC2 Auto Scaling group across multiple Availability Zones. A DevOps Engineer must create a mechanism in which an EC2 instance can be taken out of production so its system logs can be analyzed for issues to quickly troubleshoot problems on the web tier.

How can the Engineer accomplish this task while ensuring availability and minimizing downtime?

- A. Implement Amazon CloudWatch Events rules. Create an AWS Lambda function that can react to an instance termination to deploy the CloudWatch Logs agent to upload the system and access logs to Amazon S3 for analysis.
- B. Terminate the EC2 instances manually. The Auto Scaling service will upload all log information to CloudWatch Logs for analysis prior to instance termination.
- C. Implement EC2 Auto Scaling groups with lifecycle hooks. Create an AWS Lambda function that can modify an EC2 instance lifecycle hook into a standby state, extract logs from the instance through a remote script execution, and place them in an Amazon S3 bucket for analysis.
- D. Implement EC2 Auto Scaling groups cooldown periods. Use EC2 instance metadata to determine the instance state, and an AWS Lambda function to snapshot Amazon EBS volumes to preserve system logs.

Answer: C

NEW QUESTION # 460

A company has a web application that uses an Amazon DynamoDB table in a single AWS Region to store user information. To support an increasingly global user base, the application must run in a secondary Region and allow users to connect to their closest Region and fail over to the secondary Region.

Which approach should be used to ensure the deployment meets these requirements?

- A. Configure DynamoDB streams to copy data between Regions, deploy the web stack in both Regions, and configure Amazon Route 53 to use a geoproximity routing policy with health checks.
- B. Define DynamoDB cross-region backups to copy data to the secondary Region, deploy the web stack in both Regions, and configure Amazon Route 53 to use a latency-based routing policy with health checks.
- **C. Convert the DynamoDB table to a global table, deploy the web stack in both Regions, and configure Amazon Route 53 to use a geoproximity routing policy with health checks.**
- D. Use DynamoDB Accelerator to copy data to the secondary Region, deploy the web stack in both Regions, and configure Amazon Route 53 to use a failover routing policy.

Answer: C

NEW QUESTION # 461

You are a DevOps Engineer for your company. You are in charge of an application that uses EC2, ELB and Autoscaling. You have been requested to get the ELB access logs. When you try to access the logs, you can see that nothing has been recorded in S3.

Why is this the case?

- A. You don't have the necessary access to the logs generated by ELB.
- **B. By default ELB access logs are disabled.**
- C. The EC2 Instances are not sending the required logs to ELB
- D. The Autoscaling service is not sending the required logs to ELB

Answer: B

Explanation:

Explanation

The AWS Documentation mentions

Access logging is an optional feature of Elastic Load Balancing that is disabled by default. After you enable access logging for your load balancer, Elastic Load Balancing captures the logs and stores them in the Amazon S3 bucket that you specify. You can disable access logging at any time.

For more information on ELB access logs please see the below link:

NEW QUESTION # 462

A development team wants to deploy an application using AWS CloudFormation stacks, but the developer IAM role does not currently have the required permissions to provision the resources specified in the CloudFormation template. A DevOps engineer is tasked with allowing developers to deploy the stacks while following the principle of least privilege.

Which solution will meet these requirements?

- A. Create an IAM policy that allows full access to CloudFormation. Attach the policy to the developer role.
- B. Create an IAM policy that allows developers to provision the required resources. Attach the policy to the developer role.
- C. Create a new IAM role with the required permissions to use as a CloudFormation service role. Grant the developer role the iam:PassRole permission.
- **D. Create a new IAM role with the required permissions to use as a CloudFormation service role. Grant the developer role a cloudformation:* action.**

Answer: D
