NEW QUESTION # 19

Before disconnecting the cables from the NVMe backplane, you should map or take a picture of the cables to ensure they are returned to the same locations. True or False?

- A. True
- B. False

Answer: A

Explanation:

When working with Supermicro MI300X GPU systems, it is highly recommended to map or take a picture of cable connections before disconnection.

Reasons:

* Ensuring Proper Reconnection# NVMe backplanes have multiple critical connections (MCIO cables, power cables, data lanes, and SAS connections). Misplacing any of these cables could cause:

* Boot failures

* Drive detection issues

* Performance degradation

* Avoiding Errors in Cable Routing# Supermicro documentation states that improperly routed cables can obstruct airflow, potentially leading to overheating in high-performance systems.

* Easing Future Troubleshooting# If issues arise after reassembly, a photo or cable map allows engineers to quickly verify whether cables were reconnected properly.

This best practice is officially recommended in Supermicro's service and installation guidelines for NVMe backplanes.
