## Cisco Supporting Cisco Devices for Field Technicians Sample Questions (Q80-Q85):

### NEW QUESTION # 80

What must be considered when installing a new fan module in a fixed-configuration Cisco Nexus switch?

- A. The fan module must be from the same manufacturing batch as the others.
- **B. The airflow direction must be consistent with other installed modules.**
- C. The size of the fan module must match the power supply.
- D. Fan modules can be installed only when the switch is powered off

**Answer: B**

Explanation:

When installing a fan module in a Cisco Nexus fixed-configuration switch, it's crucial to ensure that the airflow direction of the new fan matches the existing airflow configuration. Mismatched airflow directions can lead to inefficient cooling or even overheating of components, potentially affecting the performance or lifespan of the switch.

Cisco offers fan modules in front-to-back or back-to-front airflow variants, and consistency is required for proper thermal management. These modules are also typically hot-swappable, meaning powering down the switch is not necessary.

### NEW QUESTION # 81

What is the primary purpose of changing the configuration register when performing password recovery?

- A. To enable advanced debugging features
- B. To unlock all user accounts
- **C. To ignore the startup configuration**
- D. To erase the entire configuration

**Answer: C**

Explanation:

During password recovery on Cisco devices, the configuration register is modified to instruct the device to bypass the startup configuration stored in NVRAM. This allows administrators to access the device without being prompted for existing passwords. The standard procedure involves changing the configuration register value to 0x2142, which tells the device to ignore the startup configuration during the next boot. Once access is gained, the administrator can reset passwords and then restore the original configuration by resetting the configuration register to its default value, typically 0x2102.

### NEW QUESTION # 82

Which key sequence is used to enter the boot prompt mode when the Cisco NX-OS Software begins the software boot process?

- **A. Ctrl-C**
- B. Ctrl-X
- C. Ctrl-Z
- D. Ctrl-I

**Answer: A**

Explanation:

During the boot process of Cisco devices running NX-OS, pressing Ctrl-C at the right time will interrupt the boot sequence and bring the system to the boot loader or ROMmon mode (commonly referred to as the boot prompt).

This allows a technician to perform low-level operations such as recovering passwords, specifying an alternate boot image, or performing diagnostics.

Other options (Ctrl-X, Ctrl-Z, Ctrl-I) are not used for interrupting the boot process in Cisco NX-OS platforms.

### NEW QUESTION # 83

Which scenario would result in a speed mismatch when configuring Ethernet devices with different speed settings?

- A. One end is manually set to 100 Mbps, and the other end is set to auto-negotiation
- **B. One end is manually set to 1 Gbps, and the other end is manually set to 100 Mbps**
- C. Both ends are manually set to the same speed
- D. Both ends are set to auto-negotiation and fail, reverting to their lowest speeds

**Answer: B**

Explanation:

A speed mismatch occurs when two connected Ethernet devices are configured to operate at different speeds.

In scenario A, one device is manually set to 1 Gbps, while the other is set to 100 Mbps. Since both ends are hard-coded to different speeds, they cannot successfully negotiate a common speed, leading to a mismatch and resulting in a failed or unstable link.

In contrast, scenario B, where both ends are manually set to the same speed, ensures compatibility and stable communication.

Scenario C can lead to a duplex mismatch rather than a speed mismatch; the auto-negotiating end may default to half-duplex if it cannot determine the duplex setting of the manually configured end.

Scenario D is less common; if auto-negotiation fails, devices may revert to their lowest common speed, but this typically results in reduced performance rather than a complete mismatch.

### NEW QUESTION # 84

What is the primary purpose of backing up the endpoint configuration prior to replacing the device?

- A. To troubleshoot network connectivity issues
- B. To update the firmware of the device
- **C. To restore settings on the new device after replacement**
- D. To generate a performance report for the old device

**Answer: C**

Explanation:

Backing up the configuration of a network device before replacement is a critical step to ensure business continuity and minimize downtime. The primary purpose of this backup is to restore the existing settings onto the new device, ensuring that it operates identically to the one being replaced.

This process includes preserving interface configurations, routing protocols, access control lists, and other essential parameters. By restoring the backed-up configuration to the new device, network administrators can quickly reintegrate it into the network infrastructure without the need for manual reconfiguration, thereby reducing the risk of errors and service disruptions.

Options A, B, and D do not align with the primary objective of configuration backups in the context of device replacement.
