FMEA TYPES AND ITS EFFECTIVE LINKAGES...

- A Failure Mode Effects Analysis (FMEA) is a structured analytical tool used by an organization with cross-functional team members to identify and evaluate the potential failures of a System/Product/Processes.
- FMEA helps to establish the impact of the failure and identify and prioritize the action items with the goal of mitigating the risk levels.
- It is a living document that should be initiated prior to parts production and maintained through out the lifecycle of the product.

FMEA (Failure mode and effects Analysis) Types and Its definitions

FMEA Linkages with APQP Phases...

System FMEA

System	Function	Potential Failure mode	Effect of the Failure	Causes	Capture Failure modes which are related to systems and their interfaces/other subsystems
	System Requirement	Problem/ Issue	Effect of the problem	Reasons of the Failure	

Design FMEA

Item/Sub-system	Function	Potential Failure mode	Effect of the Failure	Causes	Capture Failure modes which are related to Function/Performance of an item/Sub-system
	Item/Part Requirement	Problem/ Issue	Effect of the problem	Reasons of the Failure	

Process FMEA

Operation/ Station	Requirements	Potential failure mode	Effect of the Failure	Causes	Capture Failure modes which are related to Mfg. processes
	Process/Op Requirement	Problem/ Issue	Effect of the problem	Reasons of the Failure

Peoplecert ITIL 4 Practitioner: Release Management Exam Sample Questions (Q18-Q23):

NEW QUESTION # 18

A service provider is conducting a capability assessment of the release management practice. It has been found that although the practice's performance is regularly reported and reviewed, most recommendations based on the reports are never implemented. What is the MAXIMUM capability level that could be given to the release management practice?

- A. Level 5
- **B. Level 2**
- C. Level 4
- D. Level 3

Answer: B

Explanation:

The ITIL capability model assesses practices based on their maturity and ability to improve. The ITIL 4 Practitioner: Release Management document outlines the capability levels: "Level 2 (Managed) indicates that the practice is planned and tracked, with performance regularly reported. Level 3 (Defined) requires standardized processes and the ability to improve based on feedback. If recommendations from performance reviews are not implemented, the practice cannot achieve Level 3" (Section 5.2).

* The scenario indicates that performance is reported and reviewed (meeting Level 2 requirements), but recommendations are not implemented, meaning there's no improvement or standardization beyond basic management.

* Level 3 requires consistent improvement and standardization, which is not met due to the lack of implementation.

* Levels 4 (Quantitatively Managed) and 5 (Optimizing) require even higher maturity, including data-driven improvements and continuous optimization, which are not applicable here.

The maximum capability level is A (Level 2), as the practice is managed but not improving.

NEW QUESTION # 19

What is MOST LIKELY to affect how significantly an organization's release management activities are dependent on partners and suppliers?

- A. The source of the organization's products and technology solutions
- B. The maturity of the release management practice
- C. The amount of automation in the release management practice
- D. The knowledge level of the organization's users

Answer: A

Explanation:

The dependency on partners and suppliers in release management is influenced by the extent to which an organization relies on external products or services. The ITIL 4 Practitioner: Release Management document explains: "The source of the organization's products and technology solutions significantly affects the dependency on partners and suppliers, as reliance on external software, hardware, or services increases the need for coordination during releases" (Section 3.4).

* Option A (The knowledge level of users) impacts user adoption but not the dependency on suppliers for release activities.

* Option B (The maturity of the practice) affects internal efficiency, not the structural dependency on external parties.

* Option C (The amount of automation) influences how releases are executed but doesn't determine the dependency on suppliers.

* Option D (The source of products and technology solutions) directly determines how much the organization relies on external parties, affecting release management dependency.

The correct answer is D, as the source of technology solutions most significantly impacts supplier dependency.

NEW QUESTION # 20

An organization invested in the development and adoption of a common approach to release management. Which metric will help the organization to understand if this initiative has been successful?

- A. The satisfaction rating given by service consumers of individual releases
- B. The number of releases that were implemented after the target implementation date
- C. The percentage of releases that do not result in incidents
- D. Alignment of release management procedures between the organization and its suppliers

Answer: C

Explanation:

A common approach to release management aims to improve the reliability and stability of releases. The ITIL 4 Practitioner: Release Management document highlights key metrics for evaluating the success of release management: "Key metrics for release management often include the percentage of releases that do not result in incidents, as this indicates the stability and reliability of the release process" (Section 5.3).

* Option A (Alignment with suppliers) is a process improvement metric but doesn't directly measure the success of the release outcomes.

* Option B (The percentage of releases that do not result in incidents) directly measures the effectiveness of the release process by assessing its impact on service stability, aligning with the goal of a common approach to reduce errors and disruptions.

* Option C (Satisfaction rating) is a valuable metric but is more subjective and less directly tied to the operational success of a common approach.

* Option D (Number of delayed releases) measures timeliness but not the quality or stability of the releases.

The best metric to assess the success of a standardized release management approach is the reduction in incidents, making B the correct answer.

NEW QUESTION # 21

A release manager has decided on a policy of not allowing users to choose to accept software updates. What is this an example of?

- A. A 'pull' approach
- B. Continuous integration
- C. Continuous delivery
- D. A 'push' approach

Answer: D

Explanation:

The ITIL 4 Practitioner: Release Management document explains the difference between push and pull approaches in release management: "In a push approach, updates are deployed to users without giving them a choice, often to ensure compliance or security. In a pull approach, users can choose when to adopt updates" (Section 3.2.3).

* Option A (A 'pull' approach) is incorrect because a pull approach allows users to choose when to accept updates, which contradicts the scenario.

* Option B (A 'push' approach) is correct, as the policy of not allowing users to choose means the updates are automatically deployed to them, fitting the definition of a push approach.

* Option C (Continuous delivery) and Option D (Continuous integration) are development practices, not release deployment strategies. Continuous delivery involves making releases available frequently, but it doesn't specify whether users must accept them (push) or can choose (pull).

The scenario describes a push approach, making B the correct answer.

NEW QUESTION # 22

During a value stream walk of the incident resolution value stream, an organization has realized that some incidents take longer to resolve because installation of overdue software updates is required. What should the organization do to improve the incident resolution times?

- A. Include release of the required updates in the incident resolution activities
- B. Include release of the required updates in the request fulfilment activities
- C. Ensure that required updates are included in the release of the new services
- D. Ensure that required updates are enforced as part of the ongoing operations and maintenance

Answer: D

Explanation:

This scenario involves using technology to improve incident resolution by addressing overdue updates. The ITIL 4 Practitioner: Release Management document states: "To prevent delays in incident resolution due to overdue updates, release management can enforce updates as part of ongoing operations and maintenance, using automated tools to ensure systems are up-to-date" (Section 4.2).

* Option A (Include updates in incident resolution activities) is reactive and inefficient, as it delays resolution by embedding release activities into incident handling.

* Option B (Ensure updates are enforced as part of ongoing operations and maintenance) is proactive, using technology to keep systems updated, thus reducing incident resolution times by preventing the issue.

* Option C (Include updates in request fulfilment activities) addresses user requests, not the root cause of incident delays.

* Option D (Ensure updates are included in the release of new services) doesn't address existing systems needing updates, only new services.

The correct answer is B, as it leverages technology in operations to proactively manage updates, aligning with ITIL 4 principles.
