```

Refer to the exhibit. An engineer must implement a remote access VPN solution that provides user and device verification. The company uses Active Directory for user authentication and ID certificates for device identity. Users are currently able to connect using only a valid username and password, even if their computer is missing the required certificate.

Which command from the Cisco ASA tunnel-group completes the requirement of verifying device identity in addition to user identity?

- A. authentication mfa
- B. ldap-attribute-map PolicyAllow
- **C. authentication aaa certificate**
- D. webvpn authorize-device

**Answer: C**

**Explanation:**

To enforce both user-based and device-based authentication on Cisco ASA, the tunnel group must include the command: authentication aaa certificate. This configuration requires that both a valid username/password (authenticated via AAA, such as Active Directory) and a trusted certificate (device identity) are present before allowing VPN access. Without this directive, only username/password credentials are validated, which leads to the scenario described in the question.
