### Amazon AWS Certified DevOps Engineer - Professional Sample Questions (Q140-Q145):

#### NEW QUESTION # 140

You want to use Code Deploy to deploy code that is hosted on your github repository. Which of the following additional services can help fulfil this requirement.

- A. Use the CodeCommit service
- C Use the CodeBatch service
- **B. Use the CodePipeline service**
- C. Use the SQS service

**Answer: B**

Explanation:

Explanation

The AWS Documentation mentions the following

AWS CodePipeline is a continuous delivery service you can use to model, visualize, and automate the steps required to release your software. You can quickly model and configure the different stages of a software release process. AWS CodePipeline automates the steps required to release your software changes continuously.

For more information on CodePipeline, please visit the below URL:

#### NEW QUESTION # 141

Your application stores sensitive information on an EBS volume attached to your EC2 instance. How can you protect your information? Choose two answers from the options given below

- **A. Create and mount a new, encrypted Amazon EBS volume. Move the data to the new volume. Delete the old Amazon EBS volume.**
- B. It is not possible to encrypt an EBS volume, you must use a lifecycle policy to transfer data to S3 for encryption.
- **C. Copy the unencrypted snapshot and check the box to encrypt the new snapshot. Volumes restored from this encrypted snapshot will also be encrypted.**
- D. Unmount the EBS volume, take a snapshot and encrypt the snapshot. Re-mount the Amazon EBS volume

**Answer: A,C**

Explanation:

Explanation

These steps are given in the AWS documentation

To migrate data between encrypted and unencrypted volumes

1) Create your destination volume (encrypted or unencrypted, depending on your need).

- 2) Attach the destination volume to the instance that hosts the data to migrate.
- 3) Make the destination volume available by following the procedures in Making an Amazon EBS Volume Available for Use. For Linux instances, you can create a mount point at /mnt/destination and mount the destination volume there.
- 4) Copy the data from your source directory to the destination volume. It may be most convenient to use a bulk-copy utility for this.

To encrypt a volume's data by means of snapshot copying

- 1) Create a snapshot of your unencrypted CBS volume. This snapshot is also unencrypted.
- 2) Copy the snapshot while applying encryption parameters. The resulting target snapshot is encrypted.
- 3) Restore the encrypted snapshot to a new volume, which is also encrypted.

#### NEW QUESTION # 142

Your application is currently running on Amazon EC2 instances behind a load balancer. Your management has decided to use a Blue/Green deployment strategy.

How should you implement this for each deployment?

- A. Using AWS CloudFormation, create a test stack for validating the code, and then deploy the code to each production Amazon EC2 instance.
- B. Set up Amazon Route 53 health checks to fail over from any Amazon EC2 instance that is currently being deployed to.
- C. Launch more Amazon EC2 instances to ensure high availability, de-register each Amazon EC2 instance from the load balancer, upgrade it, and test it, and then register it again with the load balancer.
- **D. Create a new load balancer with new Amazon EC2 instances, carry out the deployment, and then switch DNS over to the new load balancer using Amazon Route 53 after testing.**

**Answer: D**

#### NEW QUESTION # 143

You are in charge of creating a Cloudformation template that will be used to spin our resources on demand for your Devops team. The requirement is that this cloudformation template should be able to spin up resources in different regions. Which of the following aspects of Cloudformation templates can help you design the template to spin up resources based on the region.

- A. Use the parameters section in the Cloudformation template, so that based on the relevant region, the relevant resource can be spun up.
- B. Use the outputs section in the Cloudformation template, so that based on the relevant region, the relevant resource can be spun up.
- C. Use the metadata section in the Cloudformation template, so that based on the relevant region, the relevant resource can be spun up.
- **D. Use mappings section in the Cloudformation template, so that based on the relevant region, the relevant resource can be spun up.**

**Answer: D**

Explanation:

Explanation

The AWS Documentation mentions

The optional Mappings section matches a key to a corresponding set of named values. For example, if you want to set values based on a region, you can create a mapping that uses the region name as a key and contains the values you want to specify for each specific region. You use the Fn::FindInMap intrinsic function to retrieve values in a map.

For more information on mappings please refer to the below link:

<http://docs.aws.amazon.com/AWSCloudFormation/latest/UserGuide/mappings-section-structure.html>

#### NEW QUESTION # 144

Which of the following is incorrect when it comes to using the instances in an Opswork stack?

- A. You can use custom AMI'S as long as they are based on one of the AWS OpsWorks Stacks-supported AMIs
- B. You can start and stop instances manually in a stack
- C. In a stack you can use a mix of both Windows and Linux operating systems
- D. You can use time-based automatic scaling with any stack

**Answer: C**

Explanation:

Explanation

The AWS documentation mentions the following about Opswork stack

\* A stack's instances can run either Linux or Windows.

A stack can have different Linux versions or distributions on different instances, but you cannot mix Linux and Windows instances.

\* You can use custom AMIs (Amazon Machine Images), but they must be based on one of the AWS Ops Works Stacks-supported AMIs

\* You can start and stop instances manually or have AWS OpsWorks Stacks automatically scale the number of instances. You can use time-based automatic scaling with any stack; Linux stacks also can use load-based scaling.

\* In addition to using AWS OpsWorks Stacks to create Amazon EC2 instances, you can also register instances with a Linux stack that were created outside of AWS OpsWorks Stacks.

For more information on Opswork stacks, please visit the below link:
