The time and energy are all very important for the office workers. In order to get the PSE-SFW-Pro-24 certification with the less time and energy investment, you need a useful and valid Palo Alto Networks study material for your preparation. PSE-SFW-Pro-24 free download pdf will be the right material you find. The comprehensive contents of PSE-SFW-Pro-24 practice torrent can satisfied your needs and help you solve the problem in the actual test easily. Now, choose our PSE-SFW-Pro-24 study practice, you will get high scores.

Though there are three versions of our PSE-SFW-Pro-24 exam braindumps: the PDF, Software and APP online. When using the APP version for the first time, you need to ensure that the network is unblocked, and then our PSE-SFW-Pro-24 guide questions will be automatically cached. The network is no longer needed the next time you use it. You can choose any version of our PSE-SFW-Pro-24 Practice Engine that best suits your situation. It's all for you to learn better.

Of course, when you are seeking for exam materials, it is certain that you will find many different materials. However, through investigation or personal experience, you will find DumpsFree questions and answers are the best ones for your need. The candidates have not enough time to prepare the exam, while DumpsFree certification training materials are to develop to solve the problem. So, it can save much time for us. What's more important, 100% guarantee to pass Palo Alto Networks PSE-SFW-Pro-24 Exam at the first attempt. In addition, DumpsFree exam dumps will be updated at any time. If exam outline and the content change, DumpsFree can provide you with the latest information.

Palo Alto Networks Systems Engineer Professional - Software Firewall Sample Questions (Q54-Q59):

NEW QUESTION # 54

Which two software firewall types can protect egress traffic from workloads attached to an Azure vWAN hub? (Choose two.)

- A. PA-Series
- B. CN-Series
- C. VM-Series
- D. Cloud NGFW

Answer: C,D

Explanation:

Azure vWAN (Virtual WAN) is a networking service that connects on-premises locations, branches, and Azure virtual networks. Protecting egress traffic from workloads attached to a vWAN hub requires a solution that can integrate with the vWAN architecture.

* A. Cloud NGFW: Cloud NGFW is designed for cloud environments and integrates directly with Azure networking services, including vWAN. It can be deployed as a secured virtual hub or as a spoke VNet insertion to protect egress traffic.

* B. PA-Series: PA-Series are hardware appliances and are not directly deployable within Azure vWAN.

They would require complex configurations involving on-premises connectivity and backhauling traffic, which is not a typical or recommended vWAN design.

* C. CN-Series: CN-Series is designed for containerized environments and is not suitable for protecting general egress traffic from workloads connected to a vWAN hub.

* D. VM-Series: VM-Series firewalls can be deployed in Azure virtual networks that are connected to the vWAN hub. They can then be configured to inspect and control egress traffic. This is a common deployment model for VM-Series in Azure.

NEW QUESTION # 55

What are two methods or tools to directly automate the deployment of VM-Series NGFWs into supported public clouds? (Choose two.)

- A. Deployment configuration in the public cloud Panorama plugins
- B. **GitHub PaloAltoNetworks Terraform SWFW modules**
- C. **panos Terraform provider**
- D. paloaltonetworks.panos Ansible collection

Answer: B,C

Explanation:

Automating VM-Series firewall deployment in public clouds is crucial for efficient and consistent deployments. Here's a breakdown of the options:

A . GitHub PaloAltoNetworks Terraform SWFW modules: This is a VALID method. Palo Alto Networks maintains Terraform modules on GitHub specifically designed for deploying VM-Series firewalls in various cloud environments (AWS, Azure, GCP). These modules provide pre-built configurations and best practices, simplifying and automating the infrastructure provisioning.

Reference:

B . Deployment configuration in the public cloud Panorama plugins: While Panorama plugins enhance management and visibility, they don't directly automate the deployment of the VM-Series instances themselves in the cloud provider's infrastructure. Plugins primarily focus on post-deployment configuration, management, and monitoring. They rely on the instances being already deployed.

C . paloaltonetworks.panos Ansible collection: While Ansible is a powerful automation tool and the paloaltonetworks.panos collection allows for configuring and managing existing Palo Alto Networks devices, it's not the primary tool for deploying the VM-Series instances in the cloud. It's used for configuration after the instances are deployed.

D . panos Terraform provider: This is a VALID method. The Terraform provider for Palo Alto Networks firewalls (panos) allows for managing the configuration of the firewalls (like policies, objects, etc.) but also, importantly, can be used in conjunction with cloud provider Terraform providers (like aws, azure, google) to automate the entire deployment process, including the creation of the VM instances themselves.

NEW QUESTION # 56

What are three benefits of Palo Alto Networks VM-Series firewalls as they relate to direct integration with third-party network virtualization solution providers? (Choose three.)

- A. Integration with a third-party network virtualization solution allows management and deployment of the entire virtual network and hosts directly from Panorama.
- B. Integration with network virtualization solution providers allows manual deployment and management of firewall rules through multiple interfaces and front ends specific to each technology.
- C. **Integration with Cisco ACI allows insertion of a virtual firewall and enforcement of dynamic policies between endpoint groups without the need for manual policy adjustments.**
- D. **Integration with Nutanix AHV allows the firewall to be dynamically informed of changes in the environment and ensures policy is applied to virtual machines (VMs) as they join the network.**
- E. **Integration with VMware NSX provides comprehensive visibility and security of all virtualized data center traffic including intra-host ESXi virtual machine (VM) communications.**

Answer: C,D,E

Explanation:

The question focuses on the benefits of VM-Series firewalls concerning direct integration with third-party network virtualization solutions.

A . Integration with Cisco ACI allows insertion of a virtual firewall and enforcement of dynamic policies between endpoint groups without the need for manual policy adjustments. This is a key benefit. The integration between Palo Alto Networks VM-Series and Cisco ACI automates the insertion of the firewall into the traffic path and enables dynamic policy enforcement based on ACI endpoint groups (EPGs). This eliminates manual policy adjustments and simplifies operations.

C . Integration with Nutanix AHV allows the firewall to be dynamically informed of changes in the environment and ensures policy is applied to virtual machines (VMs) as they join the network. This is also a core advantage. The integration with Nutanix AHV allows the VM-Series firewall to be aware of VM lifecycle events (creation, deletion, migration). This dynamic awareness ensures that security policies are automatically applied to VMs as they are provisioned or moved within the Nutanix environment.

D . Integration with VMware NSX provides comprehensive visibility and security of all virtualized data center traffic including intra-host ESXi virtual machine (VM) communications. This is a significant benefit. The integration between VM-Series and VMware NSX provides granular visibility and security for all virtualized traffic, including east-west (VM-to-VM) traffic within the same ESXi host. This level of microsegmentation is crucial for securing modern data centers.

Why other options are incorrect:

B . Integration with a third-party network virtualization solution allows management and deployment of the entire virtual network and hosts directly from Panorama. While Panorama provides centralized management for VM-Series firewalls, it does not manage the underlying virtual network infrastructure or hosts of third-party providers like VMware NSX or Cisco ACI. These platforms have their own management planes. Panorama manages the security policies and firewalls, not the entire virtualized infrastructure.

E . Integration with network virtualization solution providers allows manual deployment and management of firewall rules through multiple interfaces and front ends specific to each technology. This is the opposite of what integration aims to achieve. The purpose of integration is to automate and simplify management, not to require manual configuration through multiple interfaces. Direct integration aims to reduce manual intervention and streamline operations.

Palo Alto Networks Reference:

To verify these points, you can refer to the following types of documentation on the Palo Alto Networks support site (live.paloaltonetworks.com):

VM-Series Deployment Guides: These guides often have sections dedicated to integrations with specific virtualization platforms like VMware NSX, Cisco ACI, and Nutanix AHV.

Solution Briefs and White Papers: Palo Alto Networks publishes documents outlining the benefits and technical details of these integrations.

Technology Partner Pages: On the Palo Alto Networks website, there are often pages dedicated to technology partners like VMware, Cisco, and Nutanix, which describe the joint solutions and integrations.

NEW QUESTION # 57

What are three valid methods that use firewall flex credits to activate VM-Series firewall licenses by specifying authcode? (Choose three.)

- A. `/license/authcodes` file of complete bootstrap package
- B. `authcodes=` key value pair of basic bootstrapping configuration
- C. `authcodes=` key value pair of Azure Vault configuration
- D. Panorama device group in Panorama SW Licensing Plugin
- E. `/config/bootstrap.xml` file of complete bootstrapping package

Answer: A,B,E

Explanation:

Firewall flex credits and authcodes are used to license VM-Series firewalls. The methods for using authcodes during bootstrapping include:

A . `/config/bootstrap.xml` file of complete bootstrapping package: The `bootstrap.xml` file is a key component of the bootstrapping process. It can contain the authcode for licensing.

B . `/license/authcodes` file of complete bootstrap package: A dedicated `authcodes` file within the bootstrap package is another valid method for providing license information.

C . Panorama device group in Panorama SW Licensing Plugin: While Panorama manages licenses, specifying authcodes directly via a device group is not the typical method for bootstrapping. Panorama usually manages licenses after the firewalls are bootstrapped and connected to Panorama.

D . `authcodes=` key value pair of Azure Vault configuration: While using Azure Key Vault for storing and retrieving secrets (like authcodes) is a good security practice for ongoing operations, it's not the primary method for initial bootstrapping using flex credits. Bootstrapping typically relies on the local bootstrap package.

E . `authcodes=` key value pair of basic bootstrapping configuration: This refers to including the authcode directly in the bootstrapping

configuration, such as in the init-cfg.txt file or via cloud-init.

NEW QUESTION # 58

Which two deployment models are supported by Cloud NGFW for AWS? (Choose two.)

- A. Hierarchical
- B. Distributed
- C. Centralized
- D. Linear

Answer: B,C

Explanation:

Comprehensive and Detailed In-Depth Step-by-Step Explanation: Cloud NGFW for AWS is a cloud-native firewall service designed to provide scalable and flexible security in Amazon Web Services (AWS) environments. The Palo Alto Networks Systems Engineer Professional - Software Firewall documentation describes the deployment models supported by Cloud NGFW to meet various architectural needs in public clouds.

* Distributed (Option B): In a distributed deployment model, Cloud NGFW instances are deployed across multiple Availability Zones (AZs) or Virtual Private Clouds (VPCs) in AWS. This model ensures scalability, high availability, and localized traffic inspection, reducing latency and improving performance. The documentation highlights distributed deployment as a key feature for large-scale AWS environments, leveraging AWS's auto-scaling and load-balancing capabilities.

* Centralized (Option D): In a centralized deployment model, a single Cloud NGFW instance or a cluster of instances serves as a central point for inspecting traffic across multiple VPCs or regions in AWS.

This model simplifies management and policy enforcement but may introduce latency for distributed workloads. The documentation notes that centralized deployment is suitable for smaller environments or specific use cases requiring unified control, integrated with AWS Transit Gateway or VPC peering.

Options A (Hierarchical) and C (Linear) are incorrect. Hierarchical deployment is not a supported model for Cloud NGFW in AWS, as it implies a multi-tiered structure not aligned with the cloud-native architecture of Cloud NGFW. Linear deployment is not a recognized model in the documentation for Cloud NGFW, which focuses on distributed and centralized approaches to meet AWS scalability and security needs.
