

Useful Instant Salesforce-AI-Specialist Discount bring you Well-Prepared New Salesforce-AI-Specialist Test Braindumps for Salesforce Salesforce Certified AI Specialist Exam

BraindumpsPrep releases 100% pass-rate Salesforce Salesforce-AI-Specialist study guide files which guarantee candidates 100% pass exam in the first attempt. It is time for you to choose a valid Salesforce Salesforce-AI-Specialist study guide, this will be your best method for clearing exam and obtain a certification. Good Salesforce-AI-Specialist Study Guide will be a shortcut for you to well-directed prepare and practice efficiently, you will avoid do much useless efforts and do something interesting.

Passing the Salesforce Certified AI Specialist Exam (Salesforce-AI-Specialist) exam requires the ability to manage time effectively. In addition to the Salesforce Salesforce-AI-Specialist exam study materials, practice is essential to prepare for and pass the Salesforce Salesforce-AI-Specialist Exam on the first try. It is critical to do self-assessment and learn time management skills.

New Salesforce-AI-Specialist Test Braindumps & Latest Salesforce-AI-Specialist Exam Duration

In today's technological world, more and more students are taking the Salesforce Salesforce-AI-Specialist exam online. While this can be a convenient way to take a Salesforce-AI-Specialist exam dumps, it can also be stressful. Luckily, BraindumpsPrep's best Salesforce Salesforce-AI-Specialist Exam Questions can help you prepare for your Salesforce-AI-Specialist certification exam and reduce your stress.

Salesforce Certified AI Specialist Exam Sample Questions (Q143-Q148):

NEW QUESTION # 143

Universal Containers wants to be able to detect with a high level confidence if content generated by a large language model (LLM) contains toxic language.

Which action should an AI Specialist take in the Trust Layer to confirm toxicity is being appropriately managed?

- A. Create a flow that sends an email to a specified address each time the toxicity score from the response exceeds a predefined threshold.
- B. Access the Toxicity Detection log in Setup and export all entries where isToxicityDetected is true.
- **C. Create a Trust Layer audit report within Data Cloud that uses a toxicity detector type filter to display toxic responses and their respective scores.**

Answer: C

Explanation:

To ensure that content generated by a large language model (LLM) is appropriately screened for toxic language, the AI Specialist

should create a Trust Layer audit report within Data Cloud. By using the toxicity detector type filter, the report can display toxic responses along with their respective toxicity scores, allowing Universal Containers to monitor and manage any toxic content generated with a high level of confidence.

* Option C is correct because it enables visibility into toxic language detection within the Trust Layer and allows for auditing responses for toxicity.

* Option A suggests checking a toxicity detection log, but Salesforce provides more comprehensive options via the audit report.

* Option B involves creating a flow, which is unnecessary for toxicity detection monitoring.

NEW QUESTION # 144

A Salesforce Administrator is exploring the capabilities of Einstein Copilot to enhance user interaction within their organization. They are particularly interested in how Einstein Copilot processes user requests and the mechanism it employs to deliver responses. The administrator is evaluating whether Einstein Copilot directly interfaces with a large language model (LLM) to fetch and display responses to user inquiries, facilitating a broad range of requests from users.

How does Einstein Copilot handle user requests in Salesforce?

- A. Einstein Copilot analyzes the user's request and LLM technology is used to generate and display the appropriate response.
- B. Einstein Copilot will trigger a flow that utilizes a prompt template to generate the message.
- C. Einstein Copilot will perform an HTTP callout to an LLM provider.

Answer: A

Explanation:

Einstein Copilot is designed to enhance user interaction within Salesforce by leveraging Large Language Models (LLMs) to process and respond to user inquiries. When a user submits a request, Einstein Copilot analyzes the input using natural language processing techniques. It then utilizes LLM technology to generate an appropriate and contextually relevant response, which is displayed directly to the user within the Salesforce interface.

Option C accurately describes this process. Einstein Copilot does not necessarily trigger a flow (Option A) or perform an HTTP callout to an LLM provider (Option B) for each user request. Instead, it integrates LLM capabilities to provide immediate and intelligent responses, facilitating a broad range of user requests.

References:

* Salesforce AI Specialist Documentation - Einstein Copilot Overview: Details how Einstein Copilot employs LLMs to interpret user inputs and generate responses within the Salesforce ecosystem.

* Salesforce Help - How Einstein Copilot Works: Explains the underlying mechanisms of how Einstein Copilot processes user requests using AI technologies.

NEW QUESTION # 145

An AI Specialist turned on Einstein Generative AI in Setup. Now, the AI Specialist would like to create custom prompt templates in Prompt Builder. However, they cannot access Prompt Builder in the Setup menu.

What is causing the problem?

- A. The Prompt Template User permission set was not assigned correctly.
- B. The large language model (LLM) was not configured correctly in Data Cloud.
- C. The Prompt Template Manager permission set was not assigned correctly.

Answer: C

Explanation:

In order to access and create custom prompt templates in Prompt Builder, the AI Specialist must have the Prompt Template Manager permission set assigned. Without this permission, they will not be able to access Prompt Builder in the Setup menu, even though Einstein Generative AI is enabled.

Option B is correct because the Prompt Template Manager permission set is required to use Prompt Builder.

Option A (Prompt Template User permission set) is incorrect because this permission allows users to use prompts, but not create or manage them.

Option C (LLM configuration in Data Cloud) is unrelated to the ability to access Prompt Builder.

NEW QUESTION # 146

An administrator wants to check the response of the Flex prompt template they've built, but the preview button is greyed out. What is the reason for this?

- A. The records related to the prompt have not been selected.
- B. The prompt has not been saved and activated,
- C. A merge field has not been inserted in the prompt.

Answer: A

Explanation:

When the preview button is greyed out in a Flex prompt template, it is often because the records related to the prompt have not been selected. Flex prompt templates pull data dynamically from Salesforce records, and if there are no records specified for the prompt, it can't be previewed since there is no content to generate based on the template.

Option B, not saving or activating the prompt, would not necessarily cause the preview button to be greyed out, but it could prevent proper functionality.

Option C, missing a merge field, would cause issues with the output but would not directly grey out the preview button.

Ensuring that the related records are correctly linked is crucial for testing and previewing how the prompt will function in real use cases.

Salesforce AI Specialist Reference:

NEW QUESTION # 147

What is a Salesforce AI Specialist able to configure in Data Masking within the Einstein Trust Layer?

- A. The encryption keys for masking
- B. The privacy data entities to be masked
- C. The profiles exempt from masking

Answer: B

Explanation:

In the Einstein Trust Layer, the Salesforce AI Specialist can configure privacy data entities to be masked (Option C). This ensures sensitive or personally identifiable information (PII) is obfuscated when processed by AI models.

* Data Masking Configuration:

* The AI Specialist defines which fields or data types (e.g., email, phone number, Social Security Number) should be masked. For example, masking the Email field in a prompt response to protect user privacy.

* This is done through declarative settings in Salesforce, where entities (standard or custom fields) are flagged for masking.

* Why Other Options Are Incorrect:

* A. Profiles exempt from masking: Exemptions are typically managed via permissions (e.g., field-level security), not directly within Einstein Trust Layer's Data Masking settings.

* B. Encryption keys for masking: Encryption is separate from masking. Masking involves obfuscation (e.g., replacing "john@example.com" with "@"), not encryption, which uses keys to secure data.
