online browsing, and you can prepare via the internet. The 220-1201 web-based practice test can be taken from Firefox, Microsoft Edge, Google Chrome, and Safari. You don't need to install or use any plugins or software to take the 220-1201 web-based practice exam. Furthermore, you can take this online mock test via any operating system.

CompTIA A+ Certification Exam: Core 1 Sample Questions (Q107-Q112):

NEW QUESTION # 107

A technician receives a notification after a network outage that indicates the printer is not reachable. Which of the following printer settings should the technician implement to prevent this issue in the future?

- A. Gateway
- **B. Static IP**
- C. APIPA
- D. DHCP

Answer: B

Explanation:

Assigning a static IP to network printers ensures the printer's address does not change after outages or DHCP lease expirations, preventing connectivity issues.

From CompTIA A+ 220-1101 Official Study Guide, Objective 3.4 - Printer network configuration:

"Printers should use static IPs to ensure they remain reachable and do not change addresses after network events." Verified Source:

NEW QUESTION # 108

A customer is able to print most documents with their USB inkjet printer, but the system is unresponsive when printing a certain report from a custom application. Nothing will print until the computer is restarted and the printer is power cycled. A technician remotes into the PC and confirms that the spooler stops working when this report is sent. After cleaning the spooler and reinstalling the drivers from the manufacturer's website, the issue persists. No other sites using the application report similar issues. Which of the following is most likely causing the issue?

- A. The manufacturer is curating content before it reaches the device to preserve ink.
- B. The system is using the PostScript language instead of the PCL.
- **C. The application has a bug that the developer needs to address.**
- D. Personal preferences have changed and documents with graphics are now online-only

Answer: C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

If a print spooler crashes specifically with one application and no issue occurs on other systems, the most likely root cause is a bug within that specific application. Restarting the spooler and reinstalling drivers resolves system-wide or hardware-related issues-not app-specific failures. This indicates the application may be sending malformed print data.

NEW QUESTION # 109

A technician is setting up a scan-to-SMB function on a multifunction printer. Which of the following connection types should the technician configure?

- A. Email server
- B. SFTP connection
- C. Print services
- **D. Network share**

Answer: D

Explanation:

The scan-to-SMB feature allows the printer to send scanned documents to a shared folder (SMB share) on the network. Setting up

a network share enables the device to securely and conveniently save files for user access.

NEW QUESTION # 110

A user reports poor performance on the application server.

INSTRUCTIONS

Click on Server 1 and Server 2 and review the information presented in each chart to determine which drives need to be replaced.

Select the appropriate replacement drive that should be used, for the least performance degradation to the server.

If at any time you would like to bring back the initial state of the simulation, please click the Reset All button.

The screenshot shows a simulation interface with two server racks, Server 1 and Server 2. Each rack has five drive bays. Server 1 is labeled 'Server 1' and Server 2 is labeled 'Server 2'. Below the racks is a table summarizing the RAID configuration and status for each server.

Status	Name	State	Layout	Bus protocol	Media	Read policy	Write policy	Stripe element size	Disk cache policy
	Server 1	Ready	RAID-5	SAS	HDD	No read ahead	Write back	64KB	Disabled
	Server 2	Degraded	RAID-5	SAS	HDD	No read ahead	Write back	64KB	Disabled

Answer:

Explanation:

See the detailed solution in explanation below.

Explanation:

The degraded status on Server 2 indicates a RAID-5 issue, typically due to a failed or failing drive. In RAID-5 configurations, when one drive fails, the system can still operate but with reduced performance as parity data is used to rebuild missing data on-the-fly.

Recommended Replacement Drive:

To minimize performance degradation, the replacement drive should be:

SAS HDD with the same specifications (64KB stripe size, no read-ahead, and write-back policy).

Matching the configuration exactly ensures seamless integration and optimizes recovery speed in the RAID-5 array.

In RAID-5, degraded performance is expected when one drive fails, as parity data needs to rebuild missing information during each read/write process. Replacing the failed drive restores the RAID array to optimal status, reducing the load on existing drives and returning the system to normal read/write performance. The write-back policy and disabled disk cache settings are designed to reduce latency and increase efficiency, essential for handling real-time applications.

A user reports poor performance on the application server.

INSTRUCTIONS

Click on Server 1 and Server 2 and review the information presented in each chart to determine which drives need to be replaced.

Select the appropriate replacement drive that should be used, for the least performance degradation to the server.

- NEW QUESTION # 111
- A user's wireless headset shows a "connected" status when turned on, but the Bluetooth list on the user's phone shows that the headset is "not connected." Which of the following should the technician do?
- A. Re-pair the devices.
 - B. Enter the PIN.
 - C. Enable Bluetooth.

- D. Turn off Wi-Fi.

Answer: A

Explanation:

Comprehensive and Detailed In-Depth Explanation:

When a device shows as not connected even though it previously paired, the most effective action is to re-pair the devices. This resets the Bluetooth connection, clears any corruption in pairing profiles, and re-establishes communication.

* Option A: Entering a PIN is only relevant during initial pairing and may not be prompted again.

* Option B: Turning off Wi-Fi doesn't typically affect Bluetooth; they operate on similar frequencies but don't conflict this way in normal use.

* Option D: If Bluetooth were disabled, the device wouldn't appear at all, not just show as "not connected." CompTIA A+ Core 1 Exam Objective Reference:

* Objective 1.5: Given a scenario, connect and configure accessories and ports of mobile devices.
