

Valid Analytics-Admn-201 Test Vce, Analytics-Admn-201 Exam Course

Are you tired of studying for the Salesforce Analytics-Admn-201 certification test without seeing any results? Look no further than TrainingDump! Our updated Analytics-Admn-201 Dumps questions are the perfect way to prepare for the exam quickly and effectively. With study materials available in three different formats, including desktop and web-based practice exams, you can choose the format that works best for you. With customizable exams and a real exam environment, our practice tests are the perfect way to prepare for the test pressure you will face during the final exam. Choose TrainingDump for your Salesforce Analytics-Admn-201 Certification test preparation today!

Salesforce Analytics-Admn-201 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">• Installation and Configuration: This section of the exam measures the skills of Server Engineers and covers the process of installing Tableau Server, understanding installation paths, identity store options, SSO integrations, SSL setup, and silent installs. Candidates also need to demonstrate the ability to configure Tableau Server by setting cache, distributing processes, customizing sites, and configuring user quotas. It further includes adding users, managing their roles and permissions, and applying Tableau's security model at different levels from sites to workbooks.
Topic 2	<ul style="list-style-type: none">• Administration: This section of the exam measures the skills of Tableau Administrators and covers the day-to-day tasks of maintaining Tableau Server. Candidates should understand how to create and manage schedules, subscriptions, backups, and restores, as well as how to use tools such as TSM, Tabcmd, and REST API. It emphasizes monitoring, server analysis, log file usage, and embedding practices. It also includes managing projects, sites, and nested structures, while contrasting end-user and administrator abilities. Knowledge of publishing, web authoring, sharing views, caching, and data source certification is also tested.

Topic 3	<ul style="list-style-type: none"> Connecting to and Preparing Data: This section of the exam measures the skills of Tableau Administrators and covers the basic understanding of Tableau Server's interface, navigation, and overall topology. Candidates are expected to recognize both client and server components, understand how these interact, and know where to find information about versions, releases, and updates. It also focuses on system requirements, including hardware, operating systems, browsers, email configurations, cloud considerations, and licensing models. Additionally, it examines knowledge of server processes, data source types, network infrastructure, and ports needed for a stable deployment.
Topic 4	<ul style="list-style-type: none"> Troubleshooting: This section of the exam measures the skills of Support Specialists and covers resolving common Tableau Server issues. Candidates must know how to reset accounts, package logs, validate site resources, rebuild search indexes, and use analysis reports. It also includes understanding the role of browser cookies and creating support requests when needed.
Topic 5	<ul style="list-style-type: none"> Migration & Upgrade: This section of the exam measures the skills of System Engineers and covers the process of upgrading and migrating Tableau Server environments. Candidates should understand how to carry out clean reinstalls, migrate servers to new hardware, and maintain backward compatibility during the process.

Analytics-Admn-201 Exam Course, Analytics-Admn-201 Latest Test Report

Success in the Salesforce Analytics-Admn-201 certification exam gives a huge boost to your career in the sector. You polish and validate your capabilities with the Salesforce Analytics-Admn-201. However, certification test demands a thorough knowledge of Salesforce Analytics-Admn-201 Exam domains from credible preparation material, and this is the part where test takers lose hope.

Salesforce Certified Tableau Server Administrator Sample Questions (Q54-Q59):

NEW QUESTION # 54

Which three data sources support Kerberos delegation with Tableau Server? (Choose three.)

- **A. SAP HANA**
- B. PostgreSQL
- **C. SQL Server**
- **D. Teradata**

Answer: A,C,D

Explanation:

Kerberos delegation allows Tableau Server to pass a user's Kerberos credentials to a data source for seamless authentication (SSO)-let's explore which sources support it:

- * Kerberos Overview:
- * Used with Active Directory (AD) for SSO in Windows environments.
- * Tableau Server delegates the user's ticket to the data source, avoiding embedded credentials.
- * Requires:
- * Data source support for Kerberos.
- * Proper configuration (e.g., SPN, constrained delegation).
- * Supported Data Sources: Per Tableau's documentation:
- * Option A (Teradata): Correct.
- * Details: Supports Kerberos delegation-common in enterprise data warehouses.
- * Config: Enable in TSM (tsm authentication kerberos configure) and set SPN for Teradata.
- * Option C (SQL Server): Correct.
- * Details: Fully supports Kerberos-widely used with AD-integrated SQL Server instances.
- * Config: Requires AD setup and "Trustworthy" delegation in SQL Server.
- * Option D (SAP HANA): Correct.
- * Details: Supports Kerberos SSO via delegation-popular in SAP ecosystems.

* Config: Needs HANA Kerberos setup (e.g., keytab) and Tableau Server integration.

* Option B (PostgreSQL): Incorrect.

* Why: Supports Kerberos authentication natively, but Tableau Server doesn't enable delegation to PostgreSQL-users must embed credentials or use other methods (e.g., OAuth).

Why This Matters: Kerberos delegation enhances security by avoiding stored passwords-knowing supported sources ensures SSO feasibility.

Reference: Tableau Server Documentation - "Kerberos Delegation" (https://help.tableau.com/current/server/en-us/kerberos_delegation.htm), "Supported Connectors" (<https://help.tableau.com/current/server/en-us/datasource.htm>).

NEW QUESTION # 55

You have a server that contains 16 processor cores. What is the default number of VizQL instances configured by the installer?

- A. 0
- B. 1
- C. 2
- **D. 3**

Answer: D

Explanation:

The VizQL Server process in Tableau Server handles rendering visualizations and processing queries for users viewing dashboards or workbooks. During installation, Tableau Server automatically configures the number of VizQL instances based on the number of processor cores on the machine, following this rule:

Default VizQL instances = 2 per node, unless manually adjusted post-installation.

In multi-node setups, additional instances may be added based on core count, but the question specifies a single server with 16 cores.

The installer does not scale VizQL instances linearly with core count by default (e.g., it doesn't set 1 instance per 4 cores). Instead: For a single-node installation, the default is 2 VizQL instances, regardless of core count (assuming the minimum hardware requirements are met: 8 cores, 32 GB RAM).

Administrators can later adjust this using TSM (e.g., tsm topology set-process) based on performance needs, but the question asks for the default configured by the installer.

Option A (4): Incorrect. Four instances might be configured manually for a 16-core server, but it's not the default.

Option B (6): Incorrect. Six instances exceed the default for a single node.

Option C (10): Incorrect. Ten instances are far beyond the default and would require manual configuration.

Option D (2): Correct. The installer sets 2 VizQL instances by default on a single-node installation.

Reference: Tableau Server Documentation - "Server Process Settings" (<https://help.tableau.com/current/server/en-us/processes.htm>).

NEW QUESTION # 56

You are the server administrator of a single-node Tableau Server installation. The server hosts five schedules that each execute once a day: Weekday 3:00 PM Extract Refresh, Weekday 5:00 PM Subscription, Weekday 2:00 AM Extract Refresh, Weekday 7:00 AM Extract Refresh, and Weekday 8:00 AM Subscription. The schedules are scheduled to execute during periods when Tableau Server is least active. The busiest period for your server is immediately after the workday begins at 9:00 AM. The office of the CEO reports that every morning at 9:00 AM, they access the views in a particular workbook. The data for these views is refreshed by a task associated with the 7:00 AM schedule. The CEO reports that the data in the views is only being refreshed about 70% of the time. What should you do to attempt to resolve the CEO's problem?

- **A. Set the priority of this task to 1**
- B. Set the priority for all other tasks to 50
- C. Set the default priority of this schedule to 50
- D. Set the priority of this task to 100

Answer: A

Explanation:

In Tableau Server, schedules manage tasks like extract refreshes and subscriptions. Each task within a schedule has a priority value (ranging from 1 to 100, where 1 is the highest priority and 100 is the lowest).

Tasks with higher priority (lower numbers) are executed before tasks with lower priority (higher numbers) when queued by the

Backgrounder process. If the Backgrounder is overloaded or delayed, lower-priority tasks may not complete on time, leading to inconsistent refreshes.

In this scenario:

The 7:00 AM Extract Refresh task is critical for the CEO's workbook, but the data is only refreshed 70% of the time by 9:00 AM. The server has a single node, meaning a single Backgrounder process handles all tasks. With five schedules (some overlapping in the early morning), contention or delays could prevent the 7:00 AM task from completing reliably before 9:00 AM.

Option C (Set the priority of this task to 1): Correct. Setting the task priority to 1 ensures it has the highest priority among all queued tasks. This increases the likelihood that the Backgrounder executes it promptly at 7:

00 AM, completing the refresh before the CEO accesses the workbook at 9:00 AM. You can adjust task priority in the Tableau Server web interface under Schedules > Tasks > Edit Priority.

Option A (Set the default priority of this schedule to 50): Incorrect. The default priority for schedules is already 50, and this option refers to the schedule's default, not the specific task. It wouldn't address the contention issue.

Option B (Set the priority for all other tasks to 50): Incorrect. This keeps all tasks at the default priority (50), leaving the 7:00 AM task without a relative advantage. It doesn't prioritize the CEO's task.

Option D (Set the priority of this task to 100): Incorrect. Priority 100 is the lowest, which would deprioritize the task, making the refresh even less reliable.

Reference: Tableau Server Documentation - "Manage Schedules and Tasks" (https://help.tableau.com/current/server/en-us/schedule_manage.htm).

NEW QUESTION # 57

What type of information is stored in the tsm maintenance backup -f<filename>.tsbak command?

- A. SMTP server settings
- B. Topology data
- C. Repository data
- D. Notification settings

Answer: C

Explanation:

The tsm maintenance backup command creates a backup file (with a .tsbak extension) that captures critical data needed to restore Tableau Server in case of failure or migration. This backup primarily includes:

Repository data: This encompasses the PostgreSQL database, which stores metadata such as workbooks, data sources, user information, permissions, schedules, and subscriptions.

Configuration data: This includes server settings like authentication methods, port configurations, and service layouts, but it does not include topology data as a separate entity (topology is part of the configuration).

The command does not back up the following:

Extract files (stored in the File Store), which must be backed up separately if needed.

Log files, which are archived using tsm maintenance ziplogs.

Option A (Notification settings) is incorrect because while notification settings are part of the configuration data stored in the repository, they are not the primary focus of the backup. The broader category is "repository data." Option B (SMTP server settings) is also incorrect for the same reason-SMTP settings are configuration data within the repository, but the backup is not limited to just these settings.

Option D (Topology data) is incorrect because topology data (e.g., how services are distributed across nodes) is part of the configuration included in the backup, but it's not stored as a standalone item. The .tsbak file is centered on the repository database.

Reference: Tableau Server Documentation - "Back Up Tableau Server Data" (https://help.tableau.com/current/server/en-us/backup_restore.htm).

NEW QUESTION # 58

You activate the same Tableau Server product key on three installations for Dev, Test, and Production. You plan to move the Test environment to new hardware. What is the recommended workflow for managing the product key?

- A. Install and activate Tableau Server on the new hardware, and then deactivate it on the old hardware
- B. Install and activate Tableau Server on the new hardware and keep the existing Test environment as a backup
- C. Deactivate the product key on the existing Test environment, and then install and activate Tableau Server on the new hardware
- D. Install and activate Tableau Server on the new hardware, and then run the following script in the old environment: tableau-server-obliterate.cmd -y -y -y

Answer: C

Explanation:

Tableau Server's licensing ties product keys to specific machines. Moving an environment requires managing activations to stay compliant. Let's break this down:

* Licensing Rules:

* A product key can be activated on multiple machines (e.g., Dev, Test, Prod), but only up to the licensed limit (typically 3 for such setups).

* Deactivation frees the key for reuse elsewhere.

* Recommended Workflow:

* Deactivate first: Use tsm licenses deactivate on the old Test machine to release the key.

* Then activate: Install on the new hardware and activate with tsm licenses activate -k <key>.

* Why: Ensures compliance and avoids activation conflicts (e.g., exceeding the key's limit).

* Option B (Deactivate on Test, then install/activate on new hardware): Correct.

* Steps:

* On old Test: tsm licenses deactivate.

* Install Tableau Server on new hardware.

* On new Test: tsm licenses activate -k <key>.

* Benefit: Clean, compliant transfer-preserves license integrity.

* Option A (Activate new, then deactivate old): Incorrect.

* Risk: If the key's limit is reached (e.g., 3 activations), the new activation fails until deactivation occurs. Order matters.

* Option C (Activate new, keep old as backup): Incorrect.

* Issue: Exceeds license limit (4 activations) and risks non-compliance. Backup requires deactivation or a separate key.

* Option D (Activate new, obliterate old): Incorrect.

* Details: tableau-server-obliterate.cmd wipes the entire install (data, config)-overkill and doesn't formally deactivate the key via TSM, potentially leaving licensing inconsistent.

Why This Matters: Proper license management prevents activation errors and ensures legal use across environments.

Reference: Tableau Server Documentation - "Manage Product Keys" (https://help.tableau.com/current/server/en-us/license_manage.htm).

NEW QUESTION # 59

.....

The Salesforce sector is an ever-evolving and rapidly growing industry that is crucial in shaping our lives today. With the growing demand for skilled Salesforce professionals, obtaining Salesforce Certified Tableau Server Administrator (Analytics-Admn-201) certification exam has become increasingly important for those who are looking to advance their careers and stay competitive in the job market. Individuals who hold Salesforce Certified Tableau Server Administrator (Analytics-Admn-201) certification exam demonstrate to their employers and clients that they have the knowledge and skills necessary to succeed in the Analytics-Admn-201 exam.
