Amazon AWS Certified Developer Associate Exam (DVA-C02) Sample Questions (Q144-Q149):

NEW QUESTION # 144

A company requires objects that are stored in Amazon S3 to be encrypted. The company is currently using server-side encryption with AWS KMS managed encryption keys (SSE-KMS). A developer needs to optimize the cost-effectiveness of the encryption mechanism without negatively affecting performance. What should the developer do to meet these requirements?

- A. Use a custom policy to limit the number of AWS KMS calls that are allowed
- B. Use S3 bucket policies to limit the principals who can create objects
- C. Configure the S3 bucket to use an S3 Bucket Key for SSE-KMS
- D. Change the encryption type to customer-provided keys.

Answer: C

NEW QUESTION # 145

You have written an application that uses the Elastic Load Balancing service to spread traffic to several web servers. Your users complain that they are sometimes forced to login again in the middle of using your application, after they have already logged in. This is not behavior you have designed.

What is a possible solution to prevent this happening?

- **A. Use ElastiCache to save session state.**
- B. Use EBS to save session state
- C. Use Glacier to save session slate.
- D. Use instance memory to save session state.
- E. Use instance storage to save session state.

NEW QUESTION # 146

A company runs its APIs using Amazon API Gateway in front of AWS Lambda functions. The company wants to add logging at the API level. Each API must have production and development environments. The developer wants to enable different logging levels in both environments.

How can these requirements be met?

- A. Set up a stage for each environment. In each stage, define a different logging level according to the logging requirements. Access the logs in Amazon CloudWatch Logs.
- **B. Set up a stage for each environment. In each stage, point to different Lambda functions that implement the logging logic in the code. Access the logs in Amazon CloudWatch Logs.**
- C. Set up a stage for each environment. In each stage, define a variable for the log level. Set the value according to the logging requirements.
- D. Set up a stage and use the same Lambda functions. In Amazon CloudWatch Logs, set up a filter based on the log level according to the logging requirements.

Answer: B

NEW QUESTION # 147

A developer needs to set up an API to provide access to an application and its resources. The developer has a TLS certificate. The developer must have the ability to change the default base URL of the API to a custom domain name. The API users are distributed globally. The solution must minimize API latency.

- **A. Create an Amazon API Gateway REST API. Use the edge-optimized endpoint type. Import the TLS certificate into AWS Certificate Manager. Create a custom domain name for the REST API. Route traffic to the custom domain name. Disable the default endpoint for the REST API.**
- B. Create an Amazon API Gateway REST API. Use the private endpoint type. Import the TLS certificate into AWS Certificate Manager. Create a custom domain name for the REST API. Route traffic to the custom domain name. Disable the default endpoint for the REST API.
- C. Create an Amazon CloudFront distribution that uses an AWS Lambda@Edge function to process API requests. Import the TLS certificate into AWS Certificate Manager and CloudFront. Add the custom domain name as an alias resource record set that is for the CloudFront distribution.
- D. Create an Amazon CloudFront distribution that uses CloudFront Functions to process API requests. Import the TLS certificate into AWS Certificate Manager and CloudFront. Add the custom domain name as an alias resource record set that is for the CloudFront distribution.

Answer: A

Explanation:

Comprehensive and Detailed Step-by-Step Explanation:

* Option C: Edge-Optimized API Gateway with Custom Domain Name:

* Edge-Optimized API Gateway: This endpoint type automatically leverages the Amazon CloudFront global distribution network, minimizing latency for API users distributed globally.

* Custom Domain Name: API Gateway supports custom domain names for APIs. Importing the TLS certificate into AWS Certificate Manager (ACM) and associating it with the custom domain name ensures secure connections.

* Disabling the Default Endpoint: Prevents direct access via the default API Gateway URL, enforcing the use of the custom domain name.

* Why Other Options Are Incorrect:

* Option A: While CloudFront can distribute API requests globally, API Gateway with edge-optimized endpoints already provides this functionality natively without requiring Lambda@Edge.

* Option B: Private endpoint types are used for internal access via VPC, which does not meet the global distribution and low-latency requirement.

* Option D: CloudFront Functions are not needed because API Gateway's edge-optimized endpoints handle global distribution efficiently.

NEW QUESTION # 148

A user has created photo editing software and hosted it on EC2. The software accepts requests from the user about the photo format and resolution and sends a message to S3 to enhance the picture accordingly. Which of the below mentioned AWS services will help make a scalable software with the AWS infrastructure in this scenario?

- A. AWS Glacier
- B. AWS Simple Notification Service
- C. AWS Elastic Transcoder
- **D. AWS Simple Queue Service**

Answer: D

Explanation:

Amazon Simple Queue Service (SQS) is a fast, reliable, scalable, and fully managed message queuing service. SQS provides a simple and cost-effective way to decouple the components of an application. The user can configure SQS, which will decouple the call between the EC2 application and S3. Thus, the application does not keep waiting for S3 to provide the data.
