

Valid C_ABAPD_2309 Test Review - Pass Guaranteed

First-grade C_ABAPD_2309 - Reliable SAP Certified Associate - Back-End Developer - ABAP Cloud Test Review

DOWNLOAD the newest RealValidExam C_ABAPD_2309 PDF dumps from Cloud Storage for free:
https://drive.google.com/open?id=1U5bOmvy5eTW7Dinvf9Y3srUpX_kjn7e_

Our team of professionals and experts has prepared C_ABAPD_2309 vce dumps by keeping the vigilant eyes on the current exam information and exam requirements. In case you failed exam with our C_ABAPD_2309 study guide we will get you 100% money back guarantee and you can contact our support if you have any questions about our C_ABAPD_2309 Real Dumps. We will be your support when you need us anytime.

SAP C_ABAPD_2309 Exam Syllabus Topics:

Topic	Details
Topic 1	Core ABAP programming: This topic covers ABAP data types, the ABAP dictionary, modularization, exceptions SAP HANA database tables, and logical expressions, operator precedence.
Topic 2	ABAP core data services and data modeling: It focuses on Core Data Services (CDS) views, SAP HANA database tables, foreign key relationships, and annotations.
Topic 3	Object-oriented design: It measures your knowledge about encapsulation, upcast, inheritance, polymorphism, and interfaces. Moreover, the topic evaluates your knowledge about constructor calls, Exception classes, and singleton pattern.

SAP - C_ABAPD_2309 - Reliable Valid SAP Certified Associate - Back-End Developer - ABAP Cloud Test Review

Now we can say that SAP Certified Associate - Back-End Developer - ABAP Cloud (C_ABAPD_2309) exam questions are real and top-notch C_ABAPD_2309 exam questions that you can expect in the upcoming SAP Certified Associate - Back-End Developer - ABAP Cloud (C_ABAPD_2309) exam. In this way, you can easily pass the C_ABAPD_2309 exam with good scores. The countless C_ABAPD_2309 Exam candidates have passed their dream SAP C_ABAPD_2309 certification exam and they all got help from real, valid, and updated C_ABAPD_2309 practice questions, You can also trust on RealValidExam and start preparation with confidence.

SAP Certified Associate - Back-End Developer - ABAP Cloud Sample Questions (Q46-Q51):

NEW QUESTION # 46

Which of the following are ABAP Cloud Development Model rules?

Note: There are 2 correct answers to this question.

- A. Build ABAP reports with either ABAP List Viewer (ALV) or SAP Fiori.
- **B. Use public SAP APIs and SAP extension points.**
- C. Build ABAP RESTful application programming model-based services.
- **D. Reverse modifications when a suitable public SAP API becomes available.**

Answer: B,D

Explanation:

* Use public SAP APIs and SAP extension points. This rule ensures that the ABAP Cloud code is stable, reliable, and compatible with the SAP solutions and the cloud operations. Public SAP APIs and SAP extension points are the only allowed interfaces and objects to access the SAP platform and the SAP applications. They are documented, tested, and supported by SAP. They also guarantee the lifecycle stability and the upgradeability of the ABAP Cloud code¹.

* Build ABAP RESTful application programming model-based services. This rule ensures that the ABAP Cloud code follows the state-of-the-art development paradigm for building cloud-ready business services. The ABAP RESTful application programming model (RAP) is a framework that provides a consistent end-to-end programming model for creating, reading, updating, and deleting (CRUD) business data. RAP also supports draft handling, authorization checks, side effects, validations, and custom actions. RAP exposes the business services as OData services that can be consumed by SAP Fiori apps or other clients².

NEW QUESTION # 47

Given the following Core Data Services View Entity Data Definition,

```
1 @AccessControl.authorizationCheck: #NOT_REQUIRED
2 DEFINE VIEW ENTITY demo_cds_data_source_matrix
3 AS SELECT FROM
4 <source>
5 {
6   KEY field_1,
7   field_2,
8   field_3
9 }
```

Which of the following types are permitted to be used for <source> on line #4? Note: There are 2 correct answers to this question.

- **A. A CDS DDIC-based view**
- B. A database view from the ABAP Dictionary
- C. An external view from the ABAP Dictionary
- **D. A database table from the ABAP Dictionary**

Answer: A,D

Explanation:

Explanation

The <source> clause in the CDS View Entity Data Definition can be used to specify the data source for the view entity. The <source> clause can accept different types of data sources, depending on the type of the view entity¹.

A database table from the ABAP Dictionary: This is a valid type of data source for a CDS View Entity Data Definition. A database table from the ABAP Dictionary is a table that is defined in the ABAP Dictionary using the keyword TABLE or TABLE OF. The name of the database table must be unique within its namespace and must not contain any special characters².

A CDS DDIC-based view: This is also a valid type of data source for a CDS View Entity Data Definition. A CDS DDIC-based view is a view that is defined in the Core Data Services using the keyword DEFINE VIEW ENTITY. The name of the CDS DDIC-

based view must be unique within its namespace and must not contain any special characters³.

You cannot do any of the following:

An external view from the ABAP Dictionary: This is not a valid type of data source for a CDS View Entity Data Definition. An external view from the ABAP Dictionary is a view that is defined in an external application using any language supported by SAP, such as SQL, PL/SQL, or Java. The name of the external view must be unique within its namespace and must not contain any special characters⁴.

A database view from the ABAP Dictionary: This is not a valid type of data source for a CDS View Entity Data Definition. A database view from the ABAP Dictionary is a view that is defined in an external application using any language supported by SAP, such as SQL, PL/SQL, or Java. The name of the database view must be unique within its namespace and must not contain any special characters⁴.

NEW QUESTION # 48

What is the purpose of a foreign key relationship between two tables in the ABAP Dictionary?

- A. To document the relationship between the two tables
- B. To create a corresponding foreign key relationship in the database
- C. To ensure the integrity of data in the corresponding database tables

Answer: C

Explanation:

Explanation

The purpose of a foreign key relationship between two tables in the ABAP Dictionary is to ensure the integrity of data in the corresponding database tables. A foreign key relationship defines a logical link between a foreign key table and a check table, where the foreign key fields of the former are assigned to the primary key fields of the latter. This means that the values entered in the foreign key fields must exist in the check table, otherwise the system will reject the entry. This way, the foreign key relationship prevents the insertion of invalid or inconsistent data in the database tables.

A foreign key relationship also serves to document the relationship between the two tables in the ABAP Dictionary, but this is not its primary purpose. A foreign key relationship does not necessarily create a corresponding foreign key relationship in the database, as this depends on the database system and the settings of the ABAP Dictionary. Some database systems do not support foreign keys at all, while others require additional steps to activate them. Therefore, the foreign key relationship in the ABAP Dictionary is mainly a logical concept that is enforced by the ABAP runtime environment.

NEW QUESTION # 49

Given the following Core Data Services View Entity Data Definition,

```
1 @AccessControl.authorizationCheck: #NOT_REQUIRED
2 DEFINE VIEW ENTITY demo_cds_data_source_matrix
3 AS SELECT FROM
4 <source>
5 {
6     KEY field_1,
7     field_2,
8     field_3
9 }
```

Which of the following types are permitted to be used for <source> on line #4? Note: There are 2 correct answers to this question.

- A. A CDS DDIC-based view
- B. A database view from the ABAP Dictionary

- C. An external view from the ABAP Dictionary
- D. A database table from the ABAP Dictionary

Answer: A,D

Explanation:

The <source> clause in the CDS View Entity Data Definition can be used to specify the data source for the view entity. The <source> clause can accept different types of data sources, depending on the type of the view entity¹.

* A database table from the ABAP Dictionary: This is a valid type of data source for a CDS View Entity Data Definition. A database table from the ABAP Dictionary is a table that is defined in the ABAP Dictionary using the keyword TABLE or TABLE OF. The name of the database table must be unique within its namespace and must not contain any special characters².

* A CDS DDIC-based view: This is also a valid type of data source for a CDS View Entity Data Definition. A CDS DDIC-based view is a view that is defined in the Core Data Services using the keyword DEFINE VIEW ENTITY. The name of the CDS DDIC-based view must be unique within its namespace and must not contain any special characters³.

You cannot do any of the following:

* An external view from the ABAP Dictionary: This is not a valid type of data source for a CDS View Entity Data Definition. An external view from the ABAP Dictionary is a view that is defined in an

* external application using any language supported by SAP, such as SQL, PL/SQL, or Java. The name of the external view must be unique within its namespace and must not contain any special characters⁴.

* A database view from the ABAP Dictionary: This is not a valid type of data source for a CDS View Entity Data Definition. A database view from the ABAP Dictionary is a view that is defined in an external application using any language supported by SAP, such as SQL, PL/SQL, or Java. The name of the database view must be unique within its namespace and must not contain any special characters⁴.

NEW QUESTION # 50

Why would you use Access Controls with CDS Views? Note: There are 2 correct answers to this question.

- A. Only the data corresponding to the user's authorization is transferred from the database to the application layer.
- B. The system field sy-subrc is set, giving you the result of the authorization check
- C. All of the data from the data sources is loaded into your application automatically and filtered there according to the user's authorization.
- D. You do not have to remember to implement AUTHORITY CHECK statements.

Answer: A,D

Explanation:

You would use Access Controls with CDS Views for the following reasons:

* A. Only the data corresponding to the user's authorization is transferred from the database to the application layer. This is true because Access Controls allow you to define CDS roles that specify the authorization conditions for accessing a CDS view. The CDS roles are evaluated for every user at runtime and the system automatically adds the restrictions to the selection conditions of the CDS view.

This ensures that only the data that the user is authorized to see is read from the database and transferred to the application layer.

This improves the security and the performance of the data access¹.

* C. You do not have to remember to implement AUTHORITY CHECK statements. This is true because Access Controls provide a declarative and centralized way of defining the authorization logic for a CDS view. You do not have to write any procedural code or use the AUTHORITY CHECK statement to check the user's authorization for each data source or field. The system handles the authorization check automatically and transparently for you².

The following reasons are not valid for using Access Controls with CDS Views:

* B. The system field sy-subrc is set, giving you the result of the authorization check. This is false because the system field sy-subrc is not used by Access Controls. The sy-subrc field is used by the AUTHORITY CHECK statement to indicate the result of the authorization check, but Access Controls do not use this statement. Instead, Access Controls use CDS roles to filter the data according to the user's authorization².

* D. All of the data from the data sources is loaded into your application automatically and filtered there according to the user's authorization. This is false because Access Controls do not load all the data from the data sources into the application layer. Access Controls filter the data at the database layer, where the data resides, and only transfer the data that the user is authorized to see to the application layer. This reduces the data transfer and the memory consumption of the application layer¹.
