CompTIA Cloud+ (2024) Sample Questions (Q81-Q86):

NEW QUESTION # 81

A security engineer identifies a vulnerability in a containerized application. The vulnerability can be exploited by a privileged process to read the content of the host's memory. The security engineer reviews the following Dockerfile to determine a solution to mitigate similar exploits:

```
FROM alpine:3.17
RUN apk update && apk upgrade
COPY . /myapp
ENTRYPOINT ["java", "-Xmx1g", "-jar", "myapp.jar"]
```

Which of the following is the best solution to prevent similar exploits by privileged processes?

- A. Running the container with the read-only filesystem configuration
- B. Adding the USER myappuser instruction
- C. Patching the host running the Docker daemon

- D. Changing FROM alpine:3.17 to FROM alpine:latest

Answer: B

Explanation:

Adding the "USER myappuser" instruction to the Dockerfile is the best solution to prevent similar exploits by privileged processes. This instruction ensures that the container runs as a non-privileged user instead of the root user, significantly reducing the risk of privileged exploits. Running containers with least privilege principles minimizes the potential impact of vulnerabilities, enhancing the overall security posture of the containerized environment.

Reference: The CompTIA Cloud+ framework includes security concerns, measures, and concepts for cloud operations, highlighting the importance of container security practices, such as running containers as non-root users to prevent unauthorized access and exploitation.

NEW QUESTION # 82

Which of the following describes what CRUD is typically used for?

- A. Graph databases
- **B. Relational databases**
- C. Time series databases
- D. NoSQL databases

Answer: B

Explanation:

CRUD stands for Create, Read, Update, Delete, and it is most commonly used for interacting with relational databases. These operations form the basis of persistent storage manipulation in most applications that use a database to store data. NEW QUESTION # 83

An IT manager needs to deploy a cloud solution that meets the following requirements:

- * Users must use two authentication methods to access resources.
- * Each user must have 10GB of storage space by default.

Which of the following combinations should the manager use to provision these requirements?

- A. OIDC and persistent storage
- B. SSO and external storage
- **C. MFA and storage quotas**
- D. OAuth 2.0 and ephemeral storage

Answer: C

NEW QUESTION # 84

A company has decided to adopt a microservices architecture for its applications that are deployed to the cloud. Which of the following is a major advantage of this type of architecture?

- A. Simplified communication
- B. Reduced server cost
- **C. Rapid feature deployment**
- D. Increased security

Answer: C

Explanation:

A major advantage of adopting a microservices architecture is rapid feature deployment. Microservices allow for independent development, deployment, and scaling of individual service components, enabling teams to bring new features to market more quickly and efficiently compared to monolithic architectures. References:

The CompTIA Cloud+ certification covers cloud design aspects, including architectural models like microservices, emphasizing their role in facilitating agile development practices and rapid feature release cycles in cloud environments.

NEW QUESTION # 85

A security engineer identifies a vulnerability in a containerized application. The vulnerability can be exploited by a privileged process to read the content of the host's memory. The security engineer reviews the following Dockerfile to determine a solution to mitigate similar exploits:

```
FROM alpine:3.17
RUN apk update && apk upgrade
COPY . /myapp
ENTRYPOINT ["./myapp/app"]
```

Which of the following is the best solution to prevent similar exploits by privileged processes?

- A. Running the container with the read-only filesystem configuration
- **B. Adding the USER myappuser instruction**
- C. Patching the host running the Docker daemon
- D. Changing FROM alpine:3.17 to FROM alpine:latest

Answer: B

Explanation:

Adding the "USER myappuser" instruction to the Dockerfile is the best solution to prevent similar exploits by privileged processes. This instruction ensures that the container runs as a non-privileged user instead of the root user, significantly reducing the risk of privileged exploits. Running containers with least privilege principles minimizes the potential impact of vulnerabilities, enhancing the overall security posture of the containerized environment.
