After your payment is successful, you will receive an e-mail from our system within 5-10 minutes, and then, you can use high-quality CTFL4 exam guide to learn immediately. Everyone knows that time is very important and hopes to learn efficiently to pass the CTFL4 exam. Once they discover CTFL4 practice materials, they will definitely want to seize the time to learn. So after payment, downloading into the exam database is the advantage of our products. The sooner you download and use CTFL4 guide torrent, the sooner you get the CTFL4 certificate.

BCS CTFL4 Exam Syllabus Topics:

Topic	Details
Topic 1	• Test Analysis and Design: It focuses on black-box and the collaboration-based test approach.

Topic 2	• Testing Throughout the Software Development Lifecycle: This topic explains how testing is incorporated into different development approaches. It also focuses on the concepts of test-first approaches.
Topic 3	• Static Testing: The topic covers static testing basics, the feedback and review process.

BCS ISTQB Certified Tester Foundation Level CTFL 4.0 Sample Questions (Q150-Q155):

NEW QUESTION # 150

The statement: "Test activities should start in the early stages of the lifecycle, adhering to the testing principle of early testing" is relevant to which of the recognized software development models?

- A. Iterative development model.
- B. Incremental development model.
- C. Sequential development model.
- D. All the above

Answer: D

Explanation:

The principle of early testing is applicable to all recognized software development models, including sequential, iterative, and incremental models. Starting test activities early in the lifecycle helps in identifying and addressing defects as soon as possible, which can save time and costs by preventing defects from propagating to later stages of development. This proactive approach enhances the overall quality and efficiency of the software development process. Reference: ISTQB CTFL Syllabus V4.0, Section 1.3

NEW QUESTION # 151

Which of the following statements about the value of maintaining traceability between the test basis and test work products is not true?

- A. Traceability can be useful to support the needs required by the auditing of testing
- B. Traceability can be useful for assessing the impact of a change to a test basis item on the corresponding tests
- C. Traceability can be useful for determining the most suitable test techniques to be used in a testing project
- D. Traceability can be useful for determining how many test basis items are covered by the corresponding tests

Answer: C

Explanation:

Traceability is the ability to trace the relationships between the items of the test basis, such as the requirements, the design, the risks, etc., and the test artifacts, such as the test cases, the test results, the defects, etc. Traceability can provide various benefits for the testing process, such as improving the test coverage, the test quality, the test efficiency, and the test communication. However, not all the statements given are true about the value of maintaining traceability between the test basis and test work products. The statement that is not true is option C, which says that test objectives should be the same for all test levels, although the number of tests designed at various levels can vary significantly. This statement is false, because test objectives are the goals or the purposes of testing, which can vary depending on the test level, the test type, the test technique, the test environment, the test stakeholder, etc. Test objectives can be defined in terms of the test basis, the test coverage, the test quality, the test risk, the test cost, the test time, etc. Test objectives should be specific, measurable, achievable, relevant, and time-bound, and they should be aligned with the project objectives and the quality characteristics. Test objectives should not be the same for all test levels, as different test levels have different focuses, scopes, and perspectives of testing, such as component testing, integration testing, system testing, and acceptance testing. The other statements are true about the value of maintaining traceability between the test basis and test work products, such as:

* Traceability can be useful for assessing the impact of a change to a test basis item on the corresponding tests: This statement is true, because traceability can help to identify which tests are affected by a change in the test basis, such as a new requirement, a modified design, a revised risk, etc., and to determine the necessary actions to update, re-execute, or re-evaluate the tests.

Traceability can also help to estimate the effort, the cost, and the time needed to implement the change and to verify its impact on the software system.

* Traceability can be useful for determining how many test basis items are covered by the corresponding tests: This statement is true, because traceability can help to measure the test coverage, which is the degree to which the test basis is exercised by the test cases. Traceability can help to identify which test basis items are covered, partially covered, or not covered by the tests, and to evaluate the

adequacy, the completeness, and the effectiveness of the testing process. Traceability can also help to identify the gaps, the overlaps, or the redundancies in the test coverage, and to prioritize, optimize, or improve the test cases.

* Traceability can be useful to support the needs required by the auditing of testing: This statement is true, because traceability can help to provide evidence, documentation, and justification for the testing activities, results, and outcomes. Traceability can help to demonstrate that the testing process follows the standards, the regulations, the policies, and the best practices that are applicable to the software system, the project, or the organization. Traceability can also help to verify that the testing process meets the expectations, the needs, and the satisfaction of the users and the stakeholders. References:

NEW QUESTION # 152

Which ONE of the following statements BEST applies to checklist-based testing?

- A. Checklists should be used exclusively for functional testing, as they are unsuitable for non-functional testing.
- B. Checklists should contain general guidelines to ensure that all aspects of the software are covered.
- C. Checklists should primarily consist of automated test cases to maximize efficiency.
- **D. Checklists should contain specific test conditions that can be individually and directly checked.**

Answer: D

Explanation:

Comprehensive and Detailed In-Depth Explanation: Checklist-based testing uses specific test conditions (B) that help testers ensure key aspects are validated. The checklist items can be derived from past defects, requirements, or regulatory standards.

* (A) is incorrect because general guidelines lack specificity.

* (C) is incorrect because checklists can be used for both manual and automated testing.

* (D) is incorrect because checklists are useful for both functional and non-functional testing (e.g., security, performance).

Checklists help ensure completeness without enforcing strictly scripted execution.

NEW QUESTION # 153

Which statement is true regarding confirmation testing and regression testing?

- **A. Confirmation testing aims to verify that a defect has been resolved and regression testing ensuring that existing functionality still works after a change.**
- B. Testers' involvement is essential whilst running retesting and regression testing.
- C. TESTER Involvement is essential whilst running retesting and regression testing.
- D. Confirmation testing confirms the quality of the test being run while regression testing ensures that the software still works after a change has been made.
- E. Confirmation testing is an optional activity whilst regression testing is not negotiable.

Answer: A

Explanation:

Confirmation testing, also known as retesting, is conducted to verify that specific defects have been fixed.

Regression testing, on the other hand, is performed to ensure that recent changes have not adversely affected existing features of the software. Both types of testing are crucial for maintaining the integrity and quality of the software after modifications.

NEW QUESTION # 154

Which of the following work products cannot be examined by static analysis?

- A. Source code
- B. Formal models
- C. Compiled code

- **D. Test plans**

Answer: D

Explanation:

Static analysis is the process of examining the work products of a software development or testing activity without executing them. Static analysis can be applied to various types of work products, such as requirements, design, code, test cases, etc. However, test plans are not suitable for static analysis, because they are high-level documents that describe the test objectives, scope, strategy, resources, schedule, and risks of a testing project. Test plans are not executable or formalized in a way that static analysis tools can analyze them. Therefore, option A is the correct answer.
