## **CWNP Certified Wireless IoT Solutions Administrator(2025 Edition) Sample Questions (Q13-Q18):**

### **NEW QUESTION # 13**

You are troubleshooting a problem with a wireless solution that uses MQTT where the IoT end devices are not reporting to the MQTT server/broker. At what Layer of the OSI Model should troubleshooting begin when using a bottom-up method?

- A. Layer 4
- B. Layer 6
- C. Layer 5
- D. Layer 1

### **Answer: D**

Explanation:

\* Bottom-Up Troubleshooting: The OSI model provides a structured diagnostic approach. Starting at Layer 1 ensures basic physical connectivity issues are ruled out first.

\* MQTT Relies on IP: MQTT operates at a higher layer of the OSI model, relying on TCP/IP (Layers 4 and 3) for communication. Problems at the physical layer will disrupt everything built upon it.

\* Checking the Fundamentals: Before investigating complex application issues (MQTT), verify cables, link lights, Wi-Fi signal strength, etc.

References:

Network Troubleshooting Guides: Resources that outline common Layer 1 problems and their symptoms.

### **NEW QUESTION # 14**

What is the most important consideration when deciding whether to implement a wired or wireless solution?

- A. The availability of PoE
- B. The distance between nodes
- C. The applications being used
- D. Business and system requirements

### **Answer: D**

Explanation:

\* Requirements Drive Decisions: The decision between wired or wireless must align with the solution's overall purpose, performance targets, and operational constraints.

\* Key Considerations:

\* Reliability: Does the application require guaranteed connectivity? (Wired may be favored).

\* Installation Cost: Can extensive cabling be done, or is it prohibitively expensive? (Wireless may be favored).

\* Flexibility and Scalability: Is node placement likely to change in the future? (Wireless may be favored).

\* Other Factors are Important, But Secondary: Distance, PoE availability, specific applications all matter, but they are assessed within the context of the overarching business needs.

References:

Wireless vs. Wired Network Design: Comparisons of pros and cons, highlighting how use cases guide the choice.

IoT Solution Planning: Materials on defining requirements before selecting technology.

### **NEW QUESTION # 15**

You are planning a wireless implementation. At what point should you begin to consider security requirements for the implementation?

- A. In the planning phase
- B. In the acceptance testing phase
- C. In the implementation phase
- D. During hand-off to support

**Answer: A**

Explanation:

- \* Security by Design: Security should be a fundamental consideration from the initial planning stages of any wireless implementation. This ensures:
- \* Risk Assessment: Identifying potential vulnerabilities early on.
- \* Security Controls: Choosing appropriate encryption, authentication, and access control mechanisms.
- \* Integration: Security measures are seamlessly woven into the system's architecture, not retrofitted later, which can be less effective.

#### NEW QUESTION # 16

What primary component is required to implement a wireless transceiver in a device?

- A. GPIO pins
- B. SRAM
- C. Flash memory
- D. Radio

**Answer: D**

Explanation:

- \* Wireless Transceiver: A transceiver is a combination of a transmitter and receiver used for wireless communication.
- \* Radio: The radio is the primary component responsible for:
- \* Modulation: Encoding data onto a carrier wave.
- \* Demodulation: Extracting data from a received signal.
- \* Transmission/Reception: Handling the actual sending and receiving of modulated signals over the air.

\* Transceiver: <https://en.wikipedia.org/wiki/Transceiver>

#### NEW QUESTION # 17

In a wireless link, as the signal strength decreases, what else may decrease?

- A. Interference
- B. Latency
- C. Noise
- D. Transmission speeds

**Answer: D**

Explanation:

- \* Signal Strength and Data Rate: In wireless links, weaker signal strength often directly correlates to reduced transmission speeds. Modern wireless technologies use adaptive modulation and coding, sacrificing speed for reliability when signals become weaker.
- \* Noise and Interference: While these can impact performance, they don't inherently decrease simply because signal strength drops.
- \* Latency: Latency can be affected by poor signal, but its primary drivers are distance and network congestion.
