## ISTQB ISTQB-CTFL Exam | Valid Dumps ISTQB-CTFL Free - Sample Download Free of New ISTQB-CTFL Dumps Files

UpdateDumps is offering very reliable ISTQB-CTFL real questions answers. Our key advantages are that 1. We get first-hand information; 2. We provide one -year free updates; 3. We provide one-year customer service; 4. Pass guaranteed; 5. Money back guaranteed and so on. Purchasing our ISTQB-CTFL Real Questions answers will share worry-free shopping. If you fail exam with our exam questions, you just need to send your ISTQB-CTFL failure score scanned to our email address, we will full refund to you soon without any other doubt.

## ISTQB-Foundation Level Exam Sample Questions (Q286-Q291):

### NEW QUESTION # 286

In the newest version of payroll system number of changes were made. As a tester you got a task to perform regression and confirmation tests. Which of the following project activities are related to confirmation testing?

- A. Testing to ensure the adding of a new functionalities haven't broken existing functions
- B. Testing due to the application of a new version of the interface
- **C. Testing that fixes resolved the defects in the search function**
- D. Testing if a system still works after update of an operating system

**Answer: C**

Explanation:

Confirmation testing, also known as re-testing, is performed to verify that specific defects have been successfully fixed.

Option A: "Testing due to the application of a new version of the interface" would typically involve regression testing, not confirmation testing.

Option B: "Testing that fixes resolved the defects in the search function" fits the description of confirmation testing as it focuses on ensuring that specific issues have been addressed.

Option C: "Testing if a system still works after update of an operating system" is an example of regression testing, as it checks the overall system behavior after an update.

Option D: "Testing to ensure the adding of new functionalities haven't broken existing functions" is another example of re (ISTQB not-for-profit association) (Udemy) it checks for unintended consequences of new changes.

Therefore, the correct answer is B6†source9†source.

### NEW QUESTION # 287

Which of the following is MOST likely to be an example of a PROJECT risk?

- A. A computation is not always performed correctly in some situations
- B. Specific modules do not adequately meet their intended functions according to the user
- C. A system architecture may not support some non-functional requirements
- **D. Team members' skills may not be sufficient for the assigned work**

**Answer: D**

Explanation:

A project risk relates to potential issues that could affect the overall success of the project. Among the options provided, the risk that "Team members' skills may not be sufficient for the assigned work" is clearly a project risk because it pertains to the potential failure of the project due to inadequate skillsets among the team. This risk affects the entire project's ability to meet its objectives.

### NEW QUESTION # 288

Which of the following statements BEST describes how test cases are derived from a use case?

- **A. Test cases are designed to cover various user behaviors, including basic, exceptional or alternative and error behaviors associated with human users or systems**
- B. Test cases are derived based on pair testing between a user and a tester to find defects
- C. Test cases are created using white-box test techniques to execute scenarios of use cases
- D. Test cases are derived based on non-functional requirements such as usability

## Answer: A

### Explanation:

Use cases describe a system's behavior as it responds to a request from a user. They typically consist of various scenarios, such as basic flow, alternative flow, and exceptional flow, which represent possible behaviors when a user interacts with the system. When deriving test cases from use cases, it is important to cover these different types of user behaviors.

Test cases should be designed to verify how the system behaves during each of these scenarios. This ensures that the system operates correctly for normal and error conditions encountered by human users or systems interacting with the application. Thus, test cases derived from use cases aim to cover basic, exceptional, and alternative flows, ensuring comprehensive coverage.

## NEW QUESTION # 289

Following a risk-based testing approach you have designed 10 tests to cover a product risk with a high-risk level. You want to estimate, adopting the three-point test estimation technique, the test effort required to reduce the risk level to zero by executing those 10 tests. You made the following three initial estimates:

- \* most optimistic = 6 person hours
- \* most likely = 30 person hours
- \* most pessimistic = 54 person hours

Based only on the given information, which of the following answers about the three-point test estimation technique applied to this problem is true?

- A. The final estimate is exactly 30 person hours because the technique uses the initial most likely estimate as the final estimate
- B. The final estimate is between 6 person hours and 54 person hours
- C. The final estimate is exactly 30 person hours because the technique uses the arithmetic mean of the three initial estimates as the final estimate
- D. The final estimate is between 22 person hours and 38 person hours

## Answer: D

### Explanation:

The three-point test estimation technique is a method of estimating the test effort based on three initial estimates: the most optimistic, the most likely, and the most pessimistic. The technique uses a weighted average of these three estimates to calculate the final estimate, which is also known as the expected value. The formula for the expected value is:

Expected value = (most optimistic + 4 \* most likely + most pessimistic) / 6

Using the given values, the expected value is:  
Expected value =  $(6 + 4 * 30 + 54) / 6$   
Expected value = 30 person hours

However, the expected value is not the only factor to consider when estimating the test effort. The technique also calculates the standard deviation, which is a measure of the variability or uncertainty of the estimates. The formula for the standard deviation is:

Standard deviation = (most pessimistic - most optimistic) / 6

Using the given values, the standard deviation is:

Standard deviation =  $(54 - 6) / 6$   
Standard deviation = 8 person hours

The standard deviation can be used to determine a range of possible values for the test effort, based on a certain level of confidence.

For example, using a 68% confidence level, the range is:

Expected value  $\pm$  standard deviation

Using the calculated values, the range is:

$30 \pm 8$  person hours

Therefore, the final estimate is between 22 person hours and 38 person hours, which is option A.

## NEW QUESTION # 290

Which of the following provides the BEST description of statement coverage?

- A. An experience-based test technique in which test cases are based on the tester's knowledge of past failures
- B. A white-box test technique which focuses on the percentage of executable statements that has been executed by a test suite
- C. A white-box test technique which covers the decision results which determine the next statement to be executed
- D. A black-box test technique which uses a state table to derive test cases

## Answer: B

## Explanation:

Statement coverage is a white-box test technique which focuses on executing all possible statements in the code at least once during testing. This helps in determining the percentage of executable statements that have been executed by the test suite, aiming to ensure that all parts of the program have been tested at least once (ISTQB Main Web).
