## 2025 Valid HPE6-A85 Exam Bootcamp | Professional Aruba Campus Access Associate Exam 100% Free New Study Guide

Through years of persistent efforts and centering on the innovation and the clients-based concept, our company has grown into the flagship among the industry. Our company struggles hard to improve the quality of our HPE6-A85 study materials and invests a lot of efforts and money into the research and innovation of our HPE6-A85 Study Materials. Our brand fame in the industry is like the Microsoft in the computer industry, Google in the internet industry and Apple in the cellphone industry. High quality, considerate service, constant innovation and the concept of customer first are the four pillars of our company.

HPE6-A85 certification exam is part of the Aruba Certified Mobility Associate (ACMA) certification track. The ACMA certification is the first step towards achieving the Aruba Certified Mobility Professional (ACMP) and Aruba Certified Mobility Expert (ACMX) certifications. The ACMA certification validates your skills in implementing and managing Aruba wireless LANs and is highly valued in the industry.

### HP Aruba Campus Access Associate Exam Sample Questions (Q21-Q26):

#### NEW QUESTION # 21

What is the recommended VSF topology? (Select two.)

- A. Ring
- B. Daisy chain plus MAD
- C. Full mesh plus MAD
- D. Full mesh
- E. Star

**Answer: A,B**

Explanation:

Only: Daisy chain plus MAD and ring are the recommended VSF topologies for Aruba switches. They provide high availability and redundancy for the VSF stack. MAD (Multiple Active Detection) is a mechanism to detect and resolve split-brain scenarios in a VSF stack. Reference: <https://www.arubanetworks.com/techdocs/AOS-CX/10.04/HTML/5200-6790/GUID-D6EF042E-EEEE-49F7-B67E-4CAC41CCB24D.html>

#### NEW QUESTION # 22

What does the status of "ALFOE" mean when checking LACP with "show lacp interfaces"?

- A. LACP is in a synchronizing process
- B. LACP is working fine with no problems
- C. The interface on the local switch is configured as static-LAG
- D. LACP is not configured on the peer side

**Answer: D**

Explanation:

When checking the status of LACP (Link Aggregation Control Protocol) with the command "show lacp interfaces," various flags indicate the state of the LACP negotiation. "ALFOE" indicates different states for each letter: A (Activity), L (Link), F (Aggregation), O (Synchronization), and E (Collecting). In this context, the O flag is particularly of interest. If the O flag is not set (meaning the synchronization is not achieved), it typically suggests that LACP is not configured or not functioning correctly on the peer side, hence the link is not operational as part of an LACP channel.

#### NEW QUESTION # 23

Which device configuration group types can a user define in Aruba Central during group creation? (Select two.)

- A. Security group
- B. ESP group
- C. Template group
- D. Default group

- E. UI group

**Answer: C,D**

Explanation:

Aruba Central allows you to create device configuration groups that define common settings for devices within each group. You can create different types of groups depending on your network requirements and management preferences.

Two types of groups that you can define in Aruba Central during group creation are:

- Template group: A template group allows you to create configuration templates using variables and expressions that can be applied to multiple devices or device groups. Template groups provide flexibility and scalability for managing large-scale deployments with similar configurations.
- Default group: A default group is automatically created when you add devices to Aruba Central for the first time. The default group contains basic configuration settings that are applied to all devices that are not assigned to any other group. You can modify or delete the default group as needed.

### NEW QUESTION # 24

Describe the functionality of ARP.

- A. ARP maps MAC addresses to switch ports.
- B. ARP uses multicast to build the ARP table.
- **C. ARP maps layer-3 IP addresses to layer-2 MAC addresses.**
- D. Clients do not have an ARP cache and always ask for the default gateway.

**Answer: C**

Explanation:

The Address Resolution Protocol (ARP) is used to map layer-3 IP addresses to layer-2 MAC addresses.

When a device on a network wants to communicate with another device, it uses ARP to find the MAC address that corresponds to the IP address it wishes to communicate with, allowing it to construct a frame for the local network.

### NEW QUESTION # 25

When using an Aruba standalone AP you select "Native VLAN" for the Client VLAN Assignment In which subnet will the client IPs reside?

- A. The same subnet as the mobility conductor
- B. The same subnet as the mobility controller
- C. The same subnet as the Aruba ESP gateway
- **D. The same subnet as the access point**

**Answer: D**

Explanation:

When using an Aruba standalone AP, selecting "Native VLAN" for the Client VLAN Assignment means that the clients will get their IP addresses from the same subnet as the access point's IP address. This is because the access point acts as a DHCP server for the clients in this mode.
