ISTQB CT-PT Exam Syllabus Topics:

Topic	Details
Topic 1	• Common Failures in Performance Testing and Their Causes: This section of the exam measures the skills of Performance Engineers and outlines frequent failure modes, including slow responses at various load levels, degraded performance over time, and system crashes under peak conditions. It provides examples of underlying causes such as resource leaks, insufficient capacity, and poor handling of spikes or concurrency, illustrating why robust planning and monitoring are crucial for reliable performance.
Topic 2	• Testing Types in Performance Testing: This section of the exam introduces the distinction between static and dynamic performance testing. It shows how reviews of requirements, architecture, and code can identify risks before coding is complete, and how runtime checks of resource utilization and response times reveal issues that only appear when the system is in operation.
Topic 3	• The Concept of Load Generation: This section of the exam measures the skills of Software Test Analysts and discusses how representative loads are modeled and produced to simulate user or process behavior. It explores methods such as user interface inputs, crowdsourcing, API-based calls, or protocol capture and playback, emphasizing the need for repeatable loads that accurately reflect real-world conditions.
Topic 4	• Types of Performance Testing: This section of the exam measures the skills of Software Test Analysts and covers various approaches such as load, stress, scalability, spike, endurance, concurrency, and capacity testing. It explains how each type evaluates system behavior under different conditions, helping testers and stakeholders understand how the system handles both expected and extreme usage scenarios.

Our CT-PT exam questions will help you obtain the certification.

ISTQB Certified Tester - Performance Testing Sample Questions (Q16-Q21):

NEW QUESTION # 16

What is an advantage of aggregating the results of performance testing?

- A. Aggregated results show when testing has been completed.
- **B. It is easier for stakeholders to draw a correct conclusion from aggregated results.**
- C. Aggregated results provide more detail and allow for a more complete analysis of the test.
- D. Testing is expedited when the results are aggregated.

Answer: B

Explanation:

Aggregating test results helps stakeholders understand performance trends by combining data points from multiple test runs. This makes it easier to draw conclusions about system behavior.

Option A is incorrect because aggregation may reduce detailed visibility, not increase it.

Option B is incorrect because aggregation does not expedite testing itself.

Option D is incorrect because aggregated results do not indicate test completion.

NEW QUESTION # 17

Which of the following can provide measurements for both individual and aggregated elements within a single performance test?

- A. Process optimization tracking
- B. Aggregated metrics
- C. Measuring underlying transactions
- **D. Nested transactions**

Answer: D

Explanation:

Nested transactions allow performance tests to capture both individual and aggregated elements by grouping multiple related transactions and measuring their cumulative impact.

Option A (Aggregated metrics) provides summaries but lacks insight into individual elements.

Option B (Process optimization tracking) focuses on business process improvement, not test metrics.

Option C (Measuring underlying transactions) focuses only on individual transactions.

NEW QUESTION # 18

Which of the following is considered a characteristic of stress testing?

- **A. It evaluates the system's ability to handle loads beyond its design limits.**
- B. Considers the system's ability to recover from a sudden increase of loads within the system's limits.
- C. It determines the maximum number of transactions a system can handle.
- D. It focuses on the system's ability to handle transactions over a specific timeframe.

Answer: A

Explanation:

Stress testing is designed to evaluate how a system behaves under extreme conditions, often exceeding its design limitations. The goal is to identify bottlenecks, memory leaks, and failures that occur beyond normal operating conditions.

Option A is incorrect because it refers to resilience testing, which focuses on recovery rather than stress beyond limits.

Option B is incorrect as it describes load testing, which measures performance under expected loads.

Option C is incorrect since determining the maximum transactions is a feature of capacity testing, not stress testing.

NEW QUESTION # 19

Which of the following is considered a common database protocol?

- A. SMP
- B. JUNIT
- **C. ODBC**
- D. MMS

Answer: C

Explanation:

ODBC (Open Database Connectivity) is a standard database protocol that enables applications to connect to and interact with databases regardless of vendor specifications.

Option B (JUNIT) is a unit testing framework, not a database protocol.

Option C (SMP - Symmetric Multiprocessing) relates to CPU architecture, not databases.

Option D (MMS - Multimedia Messaging Service) is related to mobile messaging, not database communication.

NEW QUESTION # 20

Which of the following is the best description of spike testing?

- A. It focuses on the ability of the system to handle loads that are at or beyond the expected peak load.
- **B. It focuses on the ability of the system to respond to quick and extreme changes in load.**
- C. It focuses on the ability of the system to meet future efficiency requirements.
- D. It focuses on the ability of the system to handle loads that are gradually increased to reach the expected maximum.

Answer: B

Explanation:

Spike testing is a type of performance testing that evaluates how a system responds to sudden, extreme increases or decreases in load. It is designed to simulate unexpected surges in user activity or workload, such as flash sales, viral events, or cyberattacks.

Option A (Gradual load increase testing) describes load testing, not spike testing.

Option B (Handling expected peak load) describes stress testing, which pushes the system to or beyond its limits but does not focus on sudden changes.

Option C (Meeting future efficiency requirements) relates to capacity planning rather than spike testing.

Spike testing helps to identify system bottlenecks, resource allocation issues, and performance degradation when traffic surges unexpectedly.
