Reliable MuleSoft-Integration-Architect-I Exam Simulator - MuleSoft-Integration-Architect-I Trustworthy Source

Our MuleSoft-Integration-Architect-I test prep embrace latest information, up-to-date knowledge and fresh ideas, encouraging the practice of thinking out of box rather than treading the same old path following a beaten track. As the industry has been developing more rapidly, our MuleSoft-Integration-Architect-I exam dumps have to be updated at irregular intervals in case of keeping pace with changes. To give you a better using environment, our experts have specialized in the technology with the system upgraded to offer you the latest MuleSoft-Integration-Architect-I Exam practices. What's more, we won't charge you in one-year cooperation; if you are pleased with it, we may have further cooperation. We will inform you of the latest preferential activities about our MuleSoft-Integration-Architect-I test braindumps to express our gratitude towards your trust.

Salesforce Certified MuleSoft Integration Architect I Sample Questions

(Q190-Q195):

NEW QUESTION # 190

A REST API is being designed to implement a Mule application.
What standard interface definition language can be used to define REST APIs?

- A. AsyncAPI Specification
- **B. OpenAPI Specification (OAS)**
- C. YAML
- D. Web Service Definition Language(WSDL)

Answer: B

NEW QUESTION # 191

A large life sciences customer plans to use the Mule Tracing module with the Mapped Diagnostic Context (MDC) logging operations to enrich logging in its Mule application and to improve tracking by providing more context in the Mule application logs. The customer also wants to improve throughput and lower the message processing latency in its Mule application flows. After installing the Mule Tracing module in the Mule application, how should logging be performed in flows in Mule applications, and what should be changed In the log4j2.xml files?

- A. In the flows, add Mule Tracing module Set logging variable operations before any Core Logger components. In log4j2.xml files, change the appender's pattern layout to use %asyncLogger placeholder and then assign the appender to an AsyncLogger element.
- B. In the flows, wrap Logger components in Async scopes. In log4j2.xml files, change the appender's pattern layout to use the %asyncLogger placeholder and then assign the appender to a Logger or Root element.
- C. In the flows, add Mule Tracing module Set logging variable operations before any Core Logger components. In log4j2.xml files, change the appender's pattern layout to use the %MDC placeholder and then assign the appender to an AsyncLogger element.
- **D. In the flows, add Mule Tracing module Set logging variable operations before any Core Logger components. In log4j2.xml files, change the appender's pattern layout to use %MDC and then assign the appender to a Logger or Root element.**

Answer: D

NEW QUESTION # 192

A payment processing company has implemented a Payment Processing API Mule application to process credit card and debit card transactions, Because the Payment Processing API handles highly sensitive information, the payment processing company requires that data must be encrypted both In-transit and at-rest.

To meet these security requirements, consumers of the Payment Processing API must create request message payloads in a JSON format specified by the API, and the message payload values must be encrypted.

How can the Payment Processing API validate requests received from API consumers?

- A. The Mule application implementation can use the APIkit module to decrypt and then validate the JSON data
- B. The Mule application implementation can use the Validation module to decrypt and then validate the JSON data
- C. The Mule application implementation can use DataWeave to decrypt the message payload and then use the JSON Scheme Validation module to validate the JSON data
- **D. A Transport Layer Security (TLS) - Inbound policy can be applied in API Manager to decrypt the message payload and the Mule application implementation can then use the JSON Validation module to validate the JSON data**

Answer: D

Explanation:

To ensure that data is encrypted both in-transit and at-rest, and to validate incoming requests to the Payment Processing API, the following approach is recommended:

- * TLS Inbound Policy: Apply a Transport Layer Security (TLS) - Inbound policy in API Manager. This policy ensures that the data is encrypted during transmission and can be decrypted by the API Manager before it reaches the Mule application.
- * Decryption: With the TLS policy applied, the message payload is decrypted when it is received by the API Manager.
- * JSON Validation: After decryption, the Mule application can use the JSON Validation module to validate the structure and content of the JSON data. This ensures that the payload conforms to the specified format and contains valid data.

This approach ensures that data is securely transmitted and properly validated upon receipt.

References:

- * Transport Layer Security (TLS) Policies
- * JSON Validation Module

NEW QUESTION # 193

The company's FTPS server login username and password

- A. The partner's PGP public key used by the company to login to the FTPS server. A TLS context key store containing the private key for ftps.partner.com The company's PGP private key that was used to sign the files
- B. The company's FTPS server login username and password. A TLS context trust store containing a public certificate for ftps.partner.com The partner's PGP public key that was used to sign the files
- C. TLS context trust store containing a public certificate for the company. The company's PGP public key that was used to sign the files
- D. The partner's PGP public key used by the company to login to the FTPS server. A TLS context key store containing the private key for the company The partner's PGP private key that was used to sign the files

Answer: C

NEW QUESTION # 194

A MuleSoft developer must implement an API as a Mule application, run the application locally, and execute unit tests against the Running application.

Which Anypoint Platform component can the developer use to full all of these requirements?

- A. Anypoint Studio
- B. API Manager
- C. Anypoint CLI
- D. API Designer

Answer: A

Explanation:

A MuleSoft developer can use Anypoint Studio to implement an API as a Mule application, run the application locally, and execute unit tests against the running application. Anypoint Studio is an integrated development environment (IDE) for designing, building, testing, and deploying Mule applications. It provides tools for local development and testing, including MUnit for creating and running unit tests, making it a comprehensive solution for developing MuleSoft applications.
