WGU Network-and-Security-Foundation Sample Questions (Q30-Q35):

NEW QUESTION # 30

A company is designing an information system and is maintaining a focus on the user experience and resulting productivity rather than on the technology itself.

What is the security principle implemented in this scenario?

- A. Zero-trust model

- B. Least common mechanism
- **C. Human-centeredness**
- D. Fail-safe

Answer: C

Explanation:

Human-centeredness in security design prioritizes user experience and productivity while implementing security measures. It ensures that security policies are intuitive and do not excessively burden users, reducing resistance to security compliance.

- * Least common mechanism minimizes shared resources to enhance security.
- * Fail-safe ensures secure defaults in case of system failure.
- * Zero-trust model assumes no inherent trust in users or devices.

NEW QUESTION # 31

An organization is the victim of an attack in which an attacker intercepts messages between two parties before transferring them to the correct destination.

What is the type of cyberattack described in this scenario?

- A. Social engineering
- **B. Man-in-the-middle attack**
- C. Credential stuffing
- D. Pharming

Answer: B

Explanation:

A man-in-the-middle (MITM) attack occurs when an attacker secretly intercepts and relays communication between two parties. This allows the attacker to steal data, modify messages, or inject malicious content without the victims' knowledge.

- * Credential stuffing uses stolen login credentials but does not involve interception.
- * Social engineering manipulates users rather than intercepting messages.
- * Pharming redirects users to fraudulent websites, but it does not intercept communication.

NEW QUESTION # 32

A host is already set up with an operating system. An administrator wants to install a hypervisor atop the operating system to allow for setting up virtual machines.

Which hypervisor should be used?

- A. Proprietary
- B. Type 1
- C. Open source
- **D. Type 2**

Answer: D

Explanation:

A Type 2 hypervisor (hosted hypervisor) runs on top of an existing operating system and allows for the creation of virtual machines. Examples include VMware Workstation and Oracle VirtualBox.

- * Type 1 hypervisors run directly on hardware without an OS (e.g., VMware ESXi, Microsoft Hyper-V).
- * Open-source and proprietary describe licensing models, not hypervisor types.

NEW QUESTION # 33

What is an IT infrastructure security tenet of the CIA triad that counters passive attacks that aim to steal or intercept data?

- **A. Confidentiality**
- B. Adaptation
- C. Integrity
- D. Availability

Answer: A

Explanation:

Confidentiality protects data from unauthorized access, including passive attacks like eavesdropping, wiretapping, and packet sniffing. Encryption, access controls, and secure authentication mechanisms help enforce confidentiality.

- * Availability ensures uptime and system accessibility.
- * Integrity ensures data accuracy but does not prevent interception.
- * Adaptation is not part of the CIA triad.

NEW QUESTION # 34

An attacker changes a computer's identification to appear as an authorized computer in a target network. Which type of cyberattack is described?

- A. Man-in-the-middle attack
- B. Pharming
- **C. IP address spoofing**
- D. Session hijacking

Answer: C

Explanation:

IP address spoofing is a cyberattack where an attacker disguises their system by falsifying its IP address, making it appear as a trusted device in a network. This technique is used for bypassing security controls, launching denial-of-service (DoS) attacks, or impersonating legitimate users.

- * Pharming redirects users to fake websites to steal credentials.
- * Man-in-the-middle attack intercepts communications between two parties.
- * Session hijacking takes over an active session but does not involve falsifying an IP address.
