Pass Guaranteed PMI - Fantastic PMI-200 - Valid PMI Agile Certified Practitioner (PMI-ACP)® Exam Pattern

PMI-200 test materials are famous for instant access to download. And you can obtain the download link and password within ten minutes, so that you can start your learning as quickly as possible. PMI-200 exam dumps are verified by professional experts, and they possess the professional knowledge for the exam, therefore you can use them at ease. In order to let you know the latest information for the exam, we offer you free update for one year, and our system will send the latest version for PMI-200 Exam Dumps to your email automatically.

PMI-ACP® certification is a valuable credential that demonstrates an individual's expertise in agile methodologies and their ability to apply them in real-world scenarios. PMI Agile Certified Practitioner (PMI-ACP)® certification is widely recognized and respected in the project management industry and can help individuals advance their careers and achieve their professional goals.

PMI-200 exam is the certification exam for the PMI-ACP® credential. PMI-200 Exam consists of 120 multiple-choice questions and is designed to test the candidate's knowledge and understanding of agile methodologies and project management. PMI-200 exam is computer-based and can be taken at any PMI-authorized testing center around the world. Candidates have three hours to complete the exam, and a passing score is 70%.

PMI Agile Certified Practitioner (PMI-ACP)® Sample Questions (Q433-Q438):

NEW QUESTION # 433

During planning sessions an agile practitioner notices that some team members do not share common ideas What should the agile

practitioner do?

- A. Capture feedback during lessons learned at the end of the iteration
- B. Create a team norms document to set participation guidelines
- C. Ask the scrum master to resolve the issue at the stand up meeting
- **D. Ask the team if they would like to adopt alternative techniques**

Answer: D

NEW QUESTION # 434

A product owner with experience in a predictive approach wants the team to develop very detailed schedules and cost estimates for the next 10 sprints. What should the Scrum Master do?

- **A. Invite the product owner to the retrospective to explain the team's approach to schedule and budget**
- B. Explain that detailed project schedules and budgets are not artifacts in agile projects
- C. Suggest the product owner start by focusing on the next 2 sprints instead of 10
- D. Spend the first few sprints to develop detailed schedules and budgets

Answer: A

NEW QUESTION # 435

An agile team is in their 2nd iteration planning session. During the session, they are debating on whether regression and integration testing should be part of every iteration or part of the hardening iteration.

What should the agile lead recommend?

- A. Regression testing should not be done by the team as part of every iteration but only as part of the hardening iteration.
- **B. Continuous integration and regression testing should be done by the team as part of every iteration.**
- C. Integration testing with other upstream or downstream applications should be done by the team as part of every iteration.
- D. Integration testing with other upstream or downstream applications and all bug fixes should be done as part of the hardening iteration.

Answer: B

Explanation:

In Agile, continuous integration and regression testing should be part of every iteration to ensure that the product is always in a potentially shippable state. These practices help catch issues early in the development process, preventing defects from accumulating and becoming harder to fix later. By integrating and testing frequently, the team ensures that new code works with existing code and that the product maintains its quality throughout the development lifecycle. This approach aligns with Agile principles of delivering working software regularly and maintaining high-quality standards throughout each iteration.

NEW QUESTION # 436

Testing Protocol

Protocol	Description	Acceptance Criteria
Unit Testing	Testing individual components to ensure they work as expected.	All components return expected results. Error handling is tested and validated.
Integration Testing	Testing the interactions between integrated components to ensure they work together correctly	Components interact seamlessly. Data flows correctly between components. No integration errors.
End-to-End Testing	Testing the complete chatbot workflow from start to finish, simulating real user interactions.	Chatbot handles complete user scenarios without failures. Expected outcomes are achieved.
Functional Testing	Verifying that the chatbot performs all specified functions correctly.	No functional discrepancies.
Performance Testing	Assessing the chatbot's performance under various conditions, including load testing and stress testing.	Chatbot responds within acceptable time limits under normal and peak loads. No crashes or slowdowns under high load.
Security Testing	Ensuring that the chatbot is secure from vulnerabilities and threats.	No security vulnerabilities are found. Data privacy and protection measures are effective.
Compatibility Testing	Ensuring the chatbot works across different devices, browsers, and platforms.	Chatbot functions correctly on all targeted devices and platforms. No compatibility issues are detected.
Regression Testing	Verifying that new updates or changes do not break existing functionality.	All previously functioning features continue to work after updates. No new bugs are introduced.
User Acceptance Testing (UAT)	Final testing by end users to ensure the chatbot meets stakeholder needs and expectations.	End users approve the chatbot for rollout. Feedback from UAT is positive. Any critical issues are resolved.

A scrum master is overseeing the launch of a chatbot for the service desk. Complaints come up post-release about edge case responses to queries. After analyzing the issues, the business decision was made to take the chatbot offline, resulting in workflow disruptions and risking the reputation.

How could this situation have been avoided? (Refer to Testing Protocol Table)

- A. Conduct user acceptance testing to ensure the chatbot meets stakeholder needs and expectations.
- B. Perform functional testing to verify the chatbot performs the required functions.
- C. Perform integration testing to minimize any bugs between the chatbot components.
- D. Conduct regression testing to ensure all previously functioning chatbot features continue to work after updates.

Answer: A

Explanation:

In the context of the chatbot's post-release complaints about edge cases in query responses, User Acceptance Testing (UAT) is the most critical step to avoid such situations. UAT ensures that the chatbot meets the stakeholder's needs and expectations, which would have included verifying its behavior with real users under real-world scenarios. This step would identify any edge case issues and make sure the chatbot is aligned with business goals before going live.

NEW QUESTION # 437

A team is creating a highly marketed, time-sensitive product. The agile coach is concerned that anything other than exceptional quality will result in bad publicity for the company. What should the agile coach ensure that developers do?

- A. Perform demos at the end of each iteration.
- B. Send coding to the quality assurance (QA) team upon completion.
- C. Establish pair programming partners, and regularly perform peer reviews.
- D. Demonstrate each feature to the client as soon as coding is complete.

Answer: A
