## Salesforce Certified MuleSoft Associate Sample Questions (Q16-Q21):

### NEW QUESTION # 16

Which Exchange asset type represents a complete API specification in RAML or OAS format?

- A. API Spec Fragments
- B. Connectors
- C. SOAP APIs
- D. REST APIs**

#### Answer: D

Explanation:

In Anypoint Exchange, a REST API asset represents a complete API specification in RAML (RESTful API Modeling Language) or OAS (OpenAPI Specification) format. Here's a detailed explanation:

REST APIs:

Definition: REST APIs are application programming interfaces that adhere to the principles of REST, allowing interaction with RESTful web services.

Specifications: Typically defined using RAML or OAS to describe the API's endpoints, methods, request/response structures, and security protocols.

Asset Types in Anypoint Exchange:

REST APIs: Represent the full API specification, including all necessary details for developers to understand and use the API.

SOAP APIs: Define APIs following the SOAP protocol, often using WSDL.

Connectors: Provide pre-built connectivity to various systems and services.

API Spec Fragments: Reusable pieces of an API specification, such as data types or security schemes, that can be included in full API specifications.

Usage:

Discoverability: Developers can easily discover, review, and reuse these API specifications in their projects.

Documentation: Provides comprehensive documentation generated from the API specification, ensuring consistency and clarity.

MuleSoft Documentation: REST APIs in Exchange

RAML and OAS: RAML, OpenAPI

## NEW QUESTION # 17

An organization is choosing between API-led connectivity and other integration approaches. According to MuleSoft, which business benefit is associated with an API-led connectivity approach using Anypoint Platform?

- A. Greater project predictability through tight coupling of systems
- B. Improved security through adoption of monolithic architectures
- C. Higher outcome repeatability through centralized development
- D. Increased developer productivity through self-service of API assets

### Answer: D

Explanation:

API-led connectivity is an approach that emphasizes the reuse of APIs to enhance agility and productivity. Here's a detailed explanation of the associated business benefits:

Self-Service of API Assets:

Definition: API-led connectivity enables developers to discover, access, and use APIs through a centralized platform like Anypoint Exchange, promoting self-service.

Productivity: Developers can quickly find and integrate existing APIs, reducing the time and effort required to build new functionalities from scratch.

Business Benefits:

Reusability: Encourages the reuse of APIs across projects, leading to faster development cycles and reduced duplication of efforts.

Agility: Enhances the ability to respond to changing business needs by providing a flexible and modular integration framework.

Scalability: Facilitates the scaling of integration solutions as business requirements grow.

API-led Connectivity: MuleSoft API-led Connectivity

Business Benefits: Why API-led Connectivity?

## NEW QUESTION # 18

According to MuleSoft, a synchronous invocation of a RESTful API using HTTP to get an individual customer record from a single system is an example of which system integration interaction pattern?

- A. One-way
- B. Batch
- C. Multicast
- D. Request-Reply

### Answer: D

Explanation:

In system integration, different interaction patterns are used depending on the communication requirements between systems. For a synchronous invocation of a RESTful API using HTTP to get an individual customer record from a single system, the Request-Reply pattern is used. Here's a detailed explanation:

Request-Reply Pattern:

Definition: This pattern involves a client sending a request to a server and waiting for a reply. The communication is synchronous, meaning the client waits for the server to process the request and send back the response.

Typical Use Case: It is used when immediate feedback is required from the server, such as retrieving a specific customer record.

RESTful API and HTTP:

Synchronous Communication: HTTP is inherently synchronous, making it suitable for Request-Reply interactions where the client expects an immediate response.

Data Retrieval: Commonly used for GET requests in RESTful APIs to retrieve data from a server.

Example:

Scenario: A client application requests customer details by making a GET request to a RESTful API endpoint. The server processes the request and returns the customer record.

MuleSoft Documentation: Integration Patterns

REST API Design: Request-Reply Pattern

## NEW QUESTION # 19

According to MuleSoft, which deployment characteristic applies to a microservices application architecture?

- A. Services exist as independent deployment artifacts and can be scaled independently of other services

- B. All services of an application can be deployed together as single Java WAR file
- C. Core business capabilities are encapsulated in a single deployable application
- D. A deployment to enhance one capability requires a redeployment of all capabilities

**Answer: A**

Explanation:

Microservices architecture is designed to enhance flexibility, scalability, and maintainability by decomposing applications into small, independent services. Here's a detailed explanation:

Independent Deployment:

Definition: Each microservice is developed, deployed, and managed independently. This allows teams to work on different services without interfering with each other.

Scalability: Services can be scaled independently based on demand, improving resource utilization and system resilience.

Benefits:

Flexibility: Enhances the ability to update or scale specific parts of an application without affecting the whole system.

Resilience: Isolates failures to individual services, preventing cascading failures across the entire application.

Technology Diversity: Allows the use of different technologies and languages best suited for each service.

Microservices Architecture: What are Microservices?

Benefits of Microservices: Microservices Characteristics

- A. MUnit
- B. Runtime Manager
- C. API Designer
- D. API Manager

**Answer: C**

Explanation:

Creating an API specification before building the API implementation is a critical step in API development. MuleSoft's API Designer is the tool designed for this purpose. Here's a detailed explanation:

API Designer:

Purpose: API Designer is a web-based tool within Anypoint Platform that allows developers to design, document, and test APIs.

Features:

Specification Languages: Supports RAML and OAS (OpenAPI Specification) for defining APIs.

Interactive Editing: Provides a graphical and text-based interface to design API specifications interactively.

Mocking Service: Allows developers to create mock services to simulate API behavior before the actual implementation.

Process:

Define API: Use API Designer to create a detailed API specification, including endpoints, methods, request/response schemas, and security schemes.

Documentation: Automatically generate API documentation that can be shared with stakeholders.

Testing: Test the API design using the built-in mocking service to ensure it meets requirements.

MuleSoft Documentation: API Designer
