<flow name= getfruits >
  <http:listener doc:name="HTTP: GET /" config-ref="HTTP_Listener_config" path="/" />
  <scatter-gather doc:name="Scatter-Gather">
    <route> <flow-ref doc:name="banana" name="banana"/> </route>
    <route> <flow-ref doc:name="apple" name="apple"/> </route>
  </scatter-gather>
  <sub-flow name="apple"><set-payload value="Apple" doc:name=""Apple" salesforce">-flow>
  <sub-flow name="banana"><set-payload value="Banana" doc:name=""Banana" /></sub-flow>

```

A

web client submits a request to <http://localhost:8081>. What is the structure of the payload at the end of the flow?

- A. 
- B. 
- C. 
- D. 

Answer: C

Explanation:

Scatter-Gather Router

The Scatter-Gather component is a routing event processor that processes a Mule event through different parallel processing routes that contain different event processors. Each route receives a reference to the Mule event and executes a sequence of one or more event processors. Each of these routes uses a separate thread to execute the event processors, and the resulting Mule event can be either the same Mule event without modifications or a new Mule event with its own payload, attributes, and variables. The Scatter-Gather component then combines the Mule events returned by each processing route into a new Mule event that is passed to the next event processor only after every route completes successfully.

The Scatter-Gather component executes each route in parallel, not sequentially. Parallel execution of routes can greatly increase the efficiency of your Mule application and may provide more information than sequential processing.
