Topic 6	<ul style="list-style-type: none"> • XM Cloud Pages: The XM Cloud Pages discusses the user experience of an application or website. In this topic, you encounter questions about individual building blocks. These blocks define the layout and content of each page.

Sitecore XM Cloud Developer Certification Exam Sample Questions (Q51-Q56):

NEW QUESTION # 51

A developer has set up a local XM Cloud development environment and would like to connect Sitecore Pages to their locally running XM Cloud instance. However, after following the necessary steps, they're facing issues with the connection. Of the options below, what is the most likely potential reason for this issue?

- A. The browser developer tools console does not support the local storage functionality required for this connection.
- B. The value of the local storage entry "Sitecore.Pages.XmCloud" should be set to enabled.
- C. The value of the local storage entry "Sitecore.Pages.LocalXmCloudUrl" should be set to <https://pages.sitecorecloud.io>.
- D. The environment variable "SITECORE_Pages_CORS_Allowed_Origins" is not correctly configured to include pages.sitecorecloud.io.

Answer: D

NEW QUESTION # 52

A developer is using the Content Editor to set placeholder restrictions on a placeholder called headless-footer. Because these restrictions have been set on the placeholder settings within /sitecore/Layout/Placeholder Settings, which of the following statements is correct?

- A. The restrictions only apply for a placeholder called headless-footer on a designated page.
- B. The restrictions apply for all placeholders called headless-footer within a single site in the XM Cloud Content Management instance.
- C. The restrictions apply for all placeholders called headless-footer on every page of every site that is in the XM Cloud Content Management instance.
- D. The restrictions only apply for subsequently created versions of a placeholder called headless-footer.

Answer: C

Explanation:

According to the Sitecore XM Cloud Documentation for Developers¹, in the Content Editor, you can set placeholder restrictions for your layout placeholders. These restrictions are applied on all pages in the site. For example, if you add restrictions for a footer, these apply for all footers on every page of the site. In this way, you can control the content that content authors can place in layout placeholders. To add a placeholder setting for a site, you need to create a placeholder item in the Layout/Placeholder Settings folder and enter the placeholder key and the allowed components².

The other options are not correct:

* A. The restrictions apply for all placeholders called headless-footer within a single site in the XM Cloud Content Management instance. This option is too narrow, as the placeholder restrictions apply to all sites that use the same placeholder key, not just one site.

* C. The restrictions only apply for a placeholder called headless-footer on a designated page. This option is too specific, as the placeholder restrictions apply to all pages that use the same placeholder key, not just one page. However, you can create placeholder restrictions on specific pages in the Experience Editor, if you want to override the default settings³.

* D. The restrictions only apply for subsequently created versions of a placeholder called headless-footer.

This option is incorrect, as the placeholder restrictions apply to all versions of the placeholder, not just the new ones.

2: Set placeholder restrictions | Sitecore Documentation³: Set placeholder restrictions | Sitecore Documentation¹: XM Cloud Documentation for Developers - Sitecore

NEW QUESTION # 53

A multinational clothing company wants to create regional sites for its online presence. Each site would follow the same branding but have unique content per region. The content architecture requires a site per region. Of the options presented below, which is the most efficient approach to deploy the rendering host?

- A. Use separate instances of XM Cloud for each brand and country to maintain separation.
- **B. A single rendering host application using the JSS multisite feature.**
- C. rendering host application deployed for each site.
- D. Create a single site collection and site for all brands and countries and also manage their resources manually.

Answer: B

Explanation:

For a multinational clothing company looking to create regional sites with the same branding but unique content per region, the most efficient approach is to use a single rendering host application that leverages the JSS multisite feature. This allows for the management of multiple sites within a single instance, facilitating shared resources and centralized updates while still allowing for regional customization.

References: The Sitecore XM Cloud documentation suggests using a single rendering host application for multiple sites, which can be achieved through configurations and the JSS multisite feature, as detailed in the editing and rendering hosts section¹. This approach aligns with the recommended practices for deploying and managing content in XM Cloud environments².

NEW QUESTION # 54

A content author is unable to edit a company webpage in Sitecore. Where is the best place to check if the user has Write access to this content item?

- A. Security Editor
- **B. Access Viewer**
- C. Administrator Tools
- D. Role Manager

Answer: B

Explanation:

According to the Sitecore XM Cloud Documentation for Developers¹, a content author needs to have the Language Read and Language Write rights on the content item in the current language². You can use the Access Viewer to check and assign the appropriate access rights for your user or role¹. You can also use the Security Editor to set the read/write rights on the language level².

NEW QUESTION # 55

A developer tried to exclude fields in a Sitecore Content Serialization package. Which file should they use to specify the excluded fields?

- **A. sitecore.json**
- B. xmcloud.build.json
- C. user.json
- D. sitecore.config

Answer: A

Explanation:

The excluded fields feature is available from CLI 4.0 or later¹. This way, you can reduce the size of your Sitecore Content Serialization package and avoid unnecessary serialization of fields that are not relevant for your deployment scenario¹.
