Efficient 100% Free SPLK-1004 – 100% Free Practical Information | SPLK-1004 Latest Dumps Files

For candidates who are going to choose the SPLK-1004 practice materials, it's maybe difficult for them to choose the exam dumps they need. If you choose us, SPLK-1004 learning materials of us will help you a lot. With skilled experts to verify SPLK-1004 questions and answers, the quality and accuracy can be ensured. In addition, we provide you with free demo to have a try before purchasing, so that we can have a try before purchasing. SPLK-1004 Learning Materials also have high pass rate, and we can ensure you to pass the exam successfully.

Splunk Core Certified Advanced Power User Sample Questions (Q67-Q72):

NEW QUESTION # 67

What file types does Splunk use to define geospatial lookups?

- A. GPX or GML files
- B. KMZ or KML files
- C. TXT files
- D. CSV files

Answer: B

Explanation:

For defining geospatial lookups, Splunk uses KMZ or KML files (Option C). KML (Keyhole Markup Language) is an XML notation for expressing geographic annotation and visualization within Internet-based maps and Earth browsers like Google Earth. KMZ is a compressed version of KML files. These file types allow Splunk to map data points to geographic locations, enabling the creation of geospatial visualizations and analyses. GPX or GML files (Option A), TXT files (Option B), and CSV files (Option D) are not specifically used for geospatial lookups in Splunk, although CSV files are commonly used for other types of lookups.

NEW QUESTION # 68

What happens when a bucket's bloom filter predicts a match?

- A. The filter is deleted from the indexer and wiped from memory.
- B. Field extractions are used to filter through the .tsidx files from that bucket.
- **C. Event data is read from journal.gz using the .tsidx files from that bucket.**
- D. Event data is read from the .tsidx files using the postings from that bucket.

Answer: C

Explanation:

In Splunk, a bloom filter is a probabilistic data structure used to quickly determine whether a given term or value might exist in a dataset, such as an index bucket. When a bloom filter predicts a match, it indicates that the term may be present, prompting Splunk to perform a more detailed check.

Specifically, when a bloom filter predicts a match:

Event data is read from journal.gz using the .tsidx files from that bucket.

This means that Splunk proceeds to read the raw event data stored in the journal.gz files, guided by the index information in the .tsidx files, to confirm the presence of the term.

NEW QUESTION # 69

What are the default time and results limits for a subsearch?

- A. 60 seconds and 50,000 results
- **B. 60 seconds and 10,000 results**
- C. 300 seconds and 50,000 results
- D. 300 seconds and 10,000 results

Answer: B

Explanation:

Comprehensive and Detailed Step by Step Explanation: The default time and results limits for a subsearch in Splunk are:

* Time Limit: 60 seconds

* Results Limit: 10,000 results

Here's why this works:

* Time Limit: Subsearches are designed to execute quickly to avoid performance bottlenecks. By default, Splunk imposes a timeout of 60 seconds for subsearches. If the subsearch exceeds this limit, it will terminate, and the outer search may fail.

* Results Limit: Subsearches are also limited to returning a maximum of 10,000 results by default. This ensures that the outer search does not get overwhelmed with too much data from the subsearch.

Other options explained:

* Option B: Incorrect because the results limit is 10,000, not 50,000.

* Option C: Incorrect because the time limit is 60 seconds, not 300 seconds.

* Option D: Incorrect because both the time limit (300 seconds) and results limit (50,000) exceed the default values.

Example: If a subsearch exceeds the default limits, you might see an error like:

Copy

1

Error in 'search': Subsearch exceeded configured timeout or result limit.

References:

* Splunk Documentation on Subsearch Limits: <https://docs.splunk.com/Documentation/Splunk/latest/Search/Aboutsubsearches>

NEW QUESTION # 70

If a search contains a subsearch, what is the order of execution?

- A. The inner search executes first.
- B. The two searches are executed in parallel.
- C. The outer search executes first.
- D. The order of execution depends on whether either search uses a stats command.

Answer: A

Explanation:

In a Splunk search containing a subsearch, the inner subsearch executes first (Option B). The result of the subsearch is then passed to the outer search. This is because the outer search often depends on the results of the inner subsearch to complete its execution. For example, a subsearch might be used to identify a list of relevant terms or values which are then used by the outer search to filter or manipulate the main dataset.

NEW QUESTION # 71

Which of these generates a summary index containing a count of events by productId?

- A. | stats count by productId
- B. | stats count by productId
- C. stats summary_index by productId
- D. | stats sum(productId)

Answer: B

Explanation:

The stats count by productId command counts the number of events for each unique productId, making it the correct command for generating a summary index based on event counts.

NEW QUESTION # 72

.....

Since it is obvious that different people have different preferences, we have prepared three kinds of different versions of our SPLK-1004 practice test, namely, PDF version, Online App version and software version. Last but not least, our customers can accumulate exam experience as well as improving their exam skills in the mock exam. There is no limitation on our software version of SPLK-1004 practice materials about how many computers our customers used to download it, but it can only be operated under the Windows operation system. I strongly believe that you can find the version you want in multiple choices of our SPLK-1004 practice test.
