Talend Core Certified Developer Exam Sample Questions (Q39-Q44):

NEW QUESTION # 39

Which statement describes a Data Preparation recipe?

- A. Datasets created for external applications
- B. List of semantic types associated with a dataset
- C. Dataset designed specifically for export
- **D. Set of functions applied to a dataset**

Answer: D

Explanation:

Comprehensive and Detailed Explanation:

In Talend Cloud Data Preparation, a recipe refers to a sequence of data transformation steps applied to a dataset. These steps can include actions like filtering, cleansing, enriching, and formatting data to prepare it for analysis or reporting. The recipe ensures that the same transformations can be consistently reapplied to the dataset or similar datasets, promoting data consistency and efficiency.

Why not other options?

* Option A: A recipe is not a dataset itself but a set of transformation instructions applied to a dataset.

* Option C: While semantic types are important, a recipe encompasses more than just listing them; it involves actionable transformations.

* Option D: Recipes are not datasets but are applied to datasets to achieve desired transformations.

NEW QUESTION # 40

After enabling the Observability Metric Collector metric generation located in the `\etc\org.talend.ipaas.rt.observability.cfg`, which additional configurations should you apply? Choose 2 answers.

- **A. Lifetime**
- B. Configure the time zone
- C. Schedule the metrics generation using CRON based trigger
- **D. Frequency**

Answer: A,D

Explanation:

Comprehensive and Detailed Explanation:

After enabling the Observability Metric Collector in Talend's configuration file (`org.talend.ipaas.rt.observability.cfg`), it's essential to set additional parameters to control the behavior of metric collection:

* Frequency (Option C): Determines how often metrics are collected. Setting this ensures that data is gathered at appropriate intervals for monitoring needs.

* Lifetime (Option D): Specifies how long the collected metrics are retained. This helps manage storage and ensures that outdated metrics are purged.

Configuring these parameters ensures that the metric collection aligns with organizational requirements for monitoring and performance analysis.

NEW QUESTION # 41

In some instances, after applying changes to a component schema, you are asked if you would like to propagate the changes. What is the significance of this prompt?

- A. Confirm that you want to apply the schema changes to both the previous and next components in the Job.
- **B. Confirm that you want to apply the schema changes to the next component in the Job.**
- C. Confirm that you want to apply the schema changes to the previous component in the Job.
- D. Confirm that you want to apply the schema changes to the selected component.

Answer: B

Explanation:

When you modify the schema of a component in Talend Studio, the application prompts you to propagate these changes. This propagation ensures that any alterations to the data structure are consistently applied throughout the Job, maintaining data integrity and coherence.

Understanding Schema Propagation:

* Purpose: Schema propagation is essential to synchronize the data structure across connected components. When a schema changes (e.g., adding or removing a column), downstream components that rely on this schema need to be updated to reflect these changes.

* Prompt Significance: The prompt serves as a confirmation to apply the schema changes to the subsequent components in the Job. By agreeing to propagate, Talend Studio automatically updates the schemas of all downstream components connected to the modified component.

Example Scenario:

Consider a Job where a tFileInputDelimited component reads data and passes it to a tMap component, which then outputs to a tFileOutputDelimited component. If you add a new column to the schema of tFileInputDelimited:

* Modification:

* You add a new column, 'emailAddress', to the tFileInputDelimited schema.

* Propagation Prompt:

* Upon making this change, Talend Studio prompts you to propagate the schema changes.

* Effect of Propagation:

* By confirming, the 'emailAddress' column is added to the schemas of all downstream components (e.g., tMap and tFileOutputDelimited). This ensures that these components recognize and can process the new column appropriately.

By understanding and utilizing schema propagation, you ensure that all components within your Talend Jobs remain synchronized, reducing errors and enhancing data processing efficiency.

NEW QUESTION # 42

You want to improve the Trust Score of your dataset as a dataset owner. Which actions should you perform? Choose 2 answers.

- A. Change the dataset score manually
- B. Use the dataset in an ETL Job
- C. Add ratings to the dataset
- D. Improve the quality of the dataset using Pipeline Designer

Answer: C,D

Explanation:

Comprehensive and Detailed Explanation:

To enhance the Trust Score of a dataset:

* Improve the quality of the dataset using Pipeline Designer (Option A):

* Utilizing Talend's Pipeline Designer allows you to cleanse, transform, and enrich your data, thereby improving its quality and, consequently, its Trust Score.

* Add ratings to the dataset (Option D):

* Encouraging users to rate the dataset increases its popularity metric, positively impacting the overall Trust Score.

Why not other options?

* Option B: The Trust Score is automatically calculated based on specific metrics; it cannot be manually altered.

* Option C: While using the dataset in ETL jobs indicates its utility, it does not directly influence the Trust Score unless it affects metrics like usage or popularity.

NEW QUESTION # 43

You want to create a generic schema using a schema defined in a Talend component in the Repository view.

How can you accomplish this?

- A. In the Schema Editor window for the component.
- B. In the Repository, by right-clicking Generic schemas.
- C. On the Advanced settings tab of the Component view.
- D. By right-clicking the component and selecting the Generic schema option.

Answer: B

Explanation:

To create a generic schema from a schema defined in a Talend component, follow these steps:

- * Open the Repository View:
- * In Talend Studio, navigate to the Repository panel, typically located on the left side of the interface.
- * Locate the 'Generic schemas' Node:
- * Within the Repository, expand the 'Metadata' section to find the 'Generic schemas' node.
- * Initiate the Generic Schema Creation Process:
- * Right-click on 'Generic schemas' and select 'Create generic schema' from the context menu.
- * Define the Schema Properties:
- * In the schema creation wizard that appears, provide the necessary properties such as 'Name' and 'Description' for the new generic schema.
- * Set Up the Schema Structure:
- * Define the schema structure by adding columns and specifying their data types as required.
- * Finalize the Schema Creation:
- * Click 'Finish' to complete the creation process. The new generic schema will now be available under the 'Generic schemas' node in the Repository.

This method allows you to create a reusable generic schema that can be applied across multiple components and Jobs within Talend Studio.
