CTFL-AT Latest Torrent, CTFL-AT Sample Questions Pdf

Users do not need to spend too much time on CTFL-AT questions torrent, only need to use their time pieces for efficient learning,

the cost is about 20 to 30 hours, users can easily master the test key and difficulties of questions and answers of CTFL-AT prep guide, and in such a short time acquisition of accurate examination skills, better answer out of step, so as to realize high pass the qualification test, has obtained the corresponding qualification certificate. Differ as a result the CTFL-AT Questions torrent geared to the needs of the user level, cultural level is uneven, have a plenty of college students in school, have a plenty of work for workers, and even some low education level of people laid off.

ISQI ISTQB Certified Tester - Foundation Level Extension - Agile Tester Sample Questions (Q34-Q39):

NEW QUESTION # 34

Which of the following is NOT a typical task performed by the tester within an Agile team?

- A. Ensuring the appropriate testing tasks are scheduled during iteration planning.
- **B. Ensuring all project status meetings are held according to the plan.**
- C. Working with business stakeholders to clarify requirements.
- D. Suggesting improvements in team retrospectives.

Answer: B

Explanation:

Explanation

The tester within an Agile team is not responsible for ensuring all project status meetings are held according to the plan. This is typically a task for the Scrum Master, who facilitates the meetings and ensures that the team follows the Agile principles and practices. The tester within an Agile team is responsible for ensuring the appropriate testing tasks are scheduled during iteration planning, suggesting improvements in team retrospectives, and working with business stakeholders to clarify requirements. These are all tasks that contribute to the quality of the software and the testing process, as well as the collaboration and communication within the team and with the customers. NEW QUESTION # 35

Which of the following activities are done in release planning?

- 1) Identifying testable user stories with acceptance criteria.
- 2) Elaborating the user stories into tasks.
- 3) Prioritizing the user stories.
- 4) Creating acceptance tests for the user stories.
- 5) Analyzing risks for each of the user stories.
- 6) Performing high level estimation for the release.

- A. Activities 2 and 4
- **B. Activities 1, 3 and 6**
- C. Activities 1, 4 and 6
- D. Activities 2, 3 and 5

Answer: B

Explanation:

Release planning is a process of defining the scope and timeline for an iterative or incremental product development project. It is used in agile or hybrid projects where a mid- to long-term planning of the product or system development or integration is required¹². Release planning involves the following activities:

* Identifying testable user stories with acceptance criteria. User stories are short descriptions of the features or functionalities that the customer or user wants from the product. Acceptance criteria are the conditions that must be met for the user story to be considered done and acceptable. Identifying testable user stories with acceptance criteria helps to define the scope and quality of the release¹³.

* Prioritizing the user stories. User stories are prioritized based on the value they deliver to the customer or user, as well as the dependencies, risks, and costs associated with them. Prioritizing the user stories helps to determine the order and frequency of the releases¹³.

* Performing high level estimation for the release. High level estimation is a technique to estimate the effort, time, and resources needed to complete the user stories in the release. High level estimation can be done using various methods, such as analogy, expert judgment, planning poker, etc. Performing high level estimation for the release helps to set realistic and achievable goals and deadlines¹³.

Therefore, activities 1, 3 and 6 are done in release planning. Activities 2, 4 and 5 are done in iteration planning, which is a more detailed and short-term planning of the work to be done in each iteration or sprint¹³. References: 1: ISTQB Foundation Level Agile Tester Syllabus, Section 2.2, Fundamental Agile Testing Principles, Practices and Processes¹; 2: Agile Release Planning in Hybrid and Agile Projects⁴; 3: How to Create an Agile Release Plan⁵

NEW QUESTION # 36

Which of the following statements about Agile retrospectives is CORRECT?

- A. During Agile retrospectives, testers should be encouraged to provide constructive suggestions only on non-testing activities.
- B. Agile retrospectives should be focused mainly on impediments that are outside the control of the team because these issues are more challenging.
- C. Unlike working sessions or meetings held in non-Agile projects, Agile retrospectives do not require follow-up activities.
- **D. In an Agile retrospective the moderator can encourage and make sure that good practices are kept by the team, by asking what the team is doing well.**

Answer: D

NEW QUESTION # 37

Which of the following sentences related to Risk-based testing is CORRECT?

- A. Risk-based testing does not fit in Agile development processes, as each iteration focuses on limited parts of the product.
- B. Risk-based testing does not fit well in Agile development processes, as short iterations mandate short test times.
- **C. Risk-based testing fits well in Agile development processes, as risks are easy to identify when the work is divided into user stories.**
- D. Risk-based testing fits well in Agile development processes, as risks are analyzed twice - during release and iteration planning.

Answer: C

NEW QUESTION # 38

Why is regression of software a high risk in agile projects?

- A. Regression is built into software as a safeguard against unexpected failures.
- B. Test automation can cause regression of software in the test environment.
- C. Test-driven development means that existing functionality is not considered.
- **D. There is code churn due to change in business needs over several sprints.**

Answer: D

Explanation:

Explanation

Regression of software is the risk that a change in one part of the software causes a defect in another part of the software that was previously working correctly. Regression of software is a high risk in agile projects because there is code churn due to change in business needs over several sprints. Code churn is the amount of code that is added, modified, or deleted in a software project over time. Code churn can indicate the volatility and complexity of the software, and the frequency and magnitude of the changes. In agile projects, code churn can be high because the business needs and the user requirements can change rapidly and frequently over several sprints, which are short iterations of development and testing. This means that the software is constantly evolving and adapting to the changing needs, and that the existing functionality and quality may be affected by the new or modified code. Therefore, regression of software is a high risk in agile projects, and it requires effective testing strategies and techniques to prevent, detect, and fix the regression defects.
