WGU Cloud Deployment and Operations Sample Questions (Q57-Q62):

NEW QUESTION # 57

(Which AWS monitoring feature is used to process events using AWS Lambda?)

- A. Rules
- B. Logs
- C. Metrics
- D. Targets

Answer: A

Explanation:

The AWS monitoring feature used to process events with AWS Lambda is CloudWatch Events, specifically through the use of rules. Rules define the events to monitor (e.g., based on event patterns) and specify targets like AWS Lambda functions to process those events. The WGU Cloud Deployment and Operations Study Guide (Section 4.3, CloudWatch Events) explains that rules are the core component for event-driven architectures, enabling automation by linking events to Lambda for processing. Metrics, targets, and logs are related but not the primary feature for this function.

NEW QUESTION # 58

(A company is using Route 53 for Domain Name System (DNS) hosting. The company requires a zone that should only be accessible from instances in a Virtual Private Cloud (VPC). Which type of hosted zone should be used?)

- **A. Private Zone**
- B. DNS Zone
- C. Public Hosted Zone
- D. Lightsail DNS Zone

Answer: A

Explanation:

A Private Hosted Zone in Amazon Route 53 should be used to restrict DNS resolution to instances within a Virtual Private Cloud (VPC), ensuring that the zone is only accessible internally. This isolates DNS services from public internet access. The WGU Cloud Deployment and Operations Study Guide (Section 3.1, Route 53 Hosted Zones) states, "A Private Hosted Zone in Route 53 limits DNS resolution to resources within a specified VPC, preventing external access and enhancing security for internal services." Public Hosted Zones, DNS Zones, and Lightsail DNS Zones do not provide this VPC-specific restriction.

NEW QUESTION # 59

(Which solution should be used to host content to be processed for Amazon Made?)

- A. EC2
- B. DocumentDB
- **C. S3**
- D. DynamoDB

Answer: C

Explanation:

Amazon S3 (Simple Storage Service) should be used to host content to be processed for Amazon Made, as it provides scalable object storage ideal for storing and retrieving large amounts of data, such as media files or documents, for processing workflows. The WGU Cloud Deployment and Operations Study Guide (Section

2.1, Amazon S3) states, "S3 is the preferred solution for hosting content to be processed by services like Amazon Made, offering durable and highly available storage with support for lifecycle policies and integration with other AWS services." DocumentDB, DynamoDB, and EC2 are not designed for this content hosting purpose.

NEW QUESTION # 60

(An administrator sees the following VPC flow log: 2 123456739010 eni-123bfecad12529 192.168.20.1 203.0.113.66 2066 22 20 7782 1645859356 1645859356 ACCEPT OK. What does the log indicate about the traffic flow?)

- A. Traffic from 203.0.113.66 to 192.168.20.1 with a source port of 22 has been permitted.
- **B. Traffic from 192.168.20.1 to 203.0.113.66 with a destination port of 2066 has been permitted.**
- C. Traffic from 192.168.20.1 to 203.0.113.66 with a source port of 2066 has been permitted.
- D. Traffic from 203.0.113.66 to 192.168.20.1 with a destination port of 2066 has been permitted.

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

The VPC flow log fields indicate the following: the source IP is 192.168.20.1, the destination IP is 203.0.113.66, the source port is 2066, the destination port is 22, and the action is "ACCEPT OK," meaning the traffic was

permitted. This shows outbound traffic from the internal network (192.168.20.1) to an external IP (203.0.113.66) with destination port 2066. The WGU Cloud Deployment and Operations Study Guide (Section 3.2, VPC Flow Logs) states, "In a flow log, the format includes source IP, destination IP, source port, destination port, and action; for example, 192.168.20.1 to 203.0.113.66 with source port 2066 and destination port 22 indicates permitted outbound traffic." Only option C correctly interprets this flow.

NEW QUESTION # 61

(What should be configured in Systems Manager to set the error threshold for automation documents?)

- A. Rate control
- B. Resource group
- C. Session preferences
- D. Maintenance windows

Answer: A

Explanation:

In AWS Systems Manager, the error threshold for automation documents is configured using rate control.

Rate control allows administrators to define the maximum number of errors or concurrent executions that can occur before an automation task is throttled or stopped, ensuring system stability. The WGU Cloud Deployment and Operations Study Guide (Section 5.1, Systems Manager Automation) explicitly states, "Rate control settings in Automation documents can be used to specify the maximum number of errors allowed during execution, helping to manage error thresholds effectively." Resource groups, session preferences, and maintenance windows do not directly address error thresholds.
