Which of the following statements is true about CSS properties that define sizes or positions with two values?

- A. It requires a minimum of one value to apply
- B. It requires a minimum of two values to apply.
- C. It accepts Hex values only
- D. It accepts pixel values only.

Explanation:

•

W3C CSS Backgrounds and Borders Module Level 3

What is the purpose of cascading style sheets (CSSs)?

- A. Structuring and describing web page content
- B. Changing the content of a web page dynamically
- C. Setting rules to define how page content looks when rendered

- D. Providing functionality that was previously provided by plug-ins

Answer: C

Explanation:

Cascading Style Sheets (CSS) are used to control the presentation of web pages, including aspects such as layout, colors, fonts, and other visual styles. They are a cornerstone technology of the World Wide Web, along with HTML and JavaScript. Here's a detailed breakdown:

* Purpose of CSS: CSS is designed to enable the separation of document content (written in HTML or a similar markup language) from document presentation, including elements such as the layout, colors, and fonts. This separation can improve content accessibility, provide more flexibility and control in the specification of presentation characteristics, enable multiple web pages to share formatting, and reduce complexity and repetition in the structural content.

* Setting Visual Rules: CSS allows developers to define rules that specify how different elements of a web page should be displayed. For example, CSS rules can change text color, font size, spacing between elements, and even the overall layout of the web page. These rules are applied by the browser to render the web page according to the defined styles.

* Cascading Nature: The term "cascading" in CSS refers to the process of combining multiple style sheets and resolving conflicts between different CSS rules. This allows developers to use different sources of style information, which can be combined in a hierarchical manner. For instance, a browser style sheet, an external style sheet, and inline styles can all contribute to the final rendering of a web page.

* Benefits of CSS:

* Consistency: By using CSS, developers can ensure a consistent look and feel across multiple web pages.

* Maintainability: CSS makes it easier to update the visual presentation of a web page without altering the HTML structure. This is particularly useful for maintaining large websites.

* Reusability: CSS rules can be reused across multiple pages, reducing redundancy and making it easier to implement changes globally.

* Examples of CSS:

css

Copy code

```
body {
background-color: lightblue;
}
h1 {
color: navy;
margin-left: 20px;
}
```

In this example, the `body` element is given a light blue background color, and the `h1` element is styled with a navy color and a left margin of 20 pixels.

NEW QUESTION # 101

Which CSS transformation method should a developer use to reposition an element horizontally on the 2-D plane?

- A. Scale (x,y)
- B. Skewx (angle)
- C. Scalex(n)
- D. TranslateX(n)

Answer: D

Explanation:

The `translateX(n)` method in CSS is used to move an element horizontally on the 2-D plane by a specified distance. This transformation repositions the element along the X-axis.

* `translateX(n)` Method: The `translateX(n)` function moves an element horizontally by `n` units. Positive values move the element to the right, while negative values move it to the left.

* Usage Example:

```
element {
transform: translateX(100px);
}
```

In this example, the element is moved 100 pixels to the right.

* Properties:

* n: This represents the distance to move the element. It can be specified in various units such as pixels (px), percentages (%), ems (em), etc.

NEW QUESTION # 102

Given the following CSS code:

Which type of selector is used?

- A. Class
- **B. ID**
- C. Group
- D. Element

Answer: B

Explanation:

The given CSS code uses the #name selector, which is an ID selector. The ID selector is used to style an element with a specific id attribute.

* ID Selector: In CSS, the ID selector is used to style the element with the specific id. The syntax for the ID selector is #id, where id is the id attribute value of the HTML element.

* Usage Example:

```
#name {  
text-align: left;  
}
```

This CSS rule will apply the text-align: left; style to the element with id="name".

* ID Selector Characteristics:

* An ID must be unique within a document, meaning it can be used only once per page.

* ID selectors are more specific than class selectors and element selectors.

* Example in HTML:

```
<div id="name">This is a div with ID "name".</div>
```
