Our career is inextricably linked with your development at least in the 1Z0-770 practice exam's perspective. So we try to emulate with the best from the start until we are now. So as the most professional company of 1Z0-770 study dumps in this area, we are dependable and reliable. We maintain the tenet of customer's orientation. If you hold any questions about our 1Z0-770 Exam Prep, our staff will solve them for you 24/7. It is our duty and honor to offer help.

Oracle APEX Developer Professional Sample Questions (Q84-Q89):

NEW QUESTION # 84

Which authentication scheme type supports authentication with social networks and enterprise identity providers that support OpenID Connect or OAuth2 standards?

- A. HTTP Header Variable
- **B. Social Sign-In**
- C. Open Door Credentials
- D. SAML Sign-In

Answer: B

Explanation:

Explanation

An authentication scheme is a rule that determines if a user is authorized to access a specific component or feature of an application, such as a page, region, button, item, etc. An authentication scheme type defines how users are authenticated when they access an application. The authentication scheme type that supports authentication with social networks and enterprise identity providers that support OpenID Connect or OAuth2 standards is Social Sign-In. Social Sign-In supports authentication with Google, Facebook, and other social networks that support these standards. The other authentication scheme types do not support authentication with social networks or enterprise identity providers. They are:

HTTP Header Variable: Authenticate users externally by storing the username in a HTTP Header variable set by the web server.

SAML Sign-In: Delegates authentication to the Security Assertion Markup Language (SAML) Sign In authentication scheme.

Open Door Credentials: Enable anyone to access your application using a built-in login page that captures a user name. Verified

NEW QUESTION # 85

Which two statements are true about a Progressive Web Application (PWA)?

- A. Enabling the PWA functionality in your APEX app adds a new navigation bar entry named Install App to your app.
- B. You can create a PWA only when creating a new application with the Create Application Wizard.
- C. To use the PWA feature, the Friendly URLs attribute in the Application Definition, Properties section must be turned Off.
- D. PWA features will be rendered even if the application is served in an unsecured environment.
- E. Enabling the PWA functionality optimizes page loading speed on a mobile device.

Answer: A,E

Explanation:

Explanation

A Progressive Web Application (PWA) is a web application that uses modern web technologies and best practices to provide a native app-like experience to users. Enabling the PWA functionality in your APEX app has the following benefits:

It optimizes page loading speed on a mobile device by caching static resources and using service workers to handle network requests.

It adds a new navigation bar entry named Install App to your app, which allows users to install the app on their device's home screen and access it offline.

It enhances the app's appearance and behavior by using a manifest file to specify the app's name, icon, theme color, orientation, and display mode.

The other options are incorrect because:

To use the PWA feature, the Friendly URLs attribute in the Application Definition, Properties section must be turned On. This attribute enables user-friendly URLs that are required for PWA functionality.

PWA features will not be rendered if the application is served in an unsecured environment. The application must use HTTPS protocol to enable PWA functionality.

You can create a PWA from an existing application or a new application with the Create Application Wizard. You just need to enable the PWA functionality in the User Interface section of the Application Definition.

NEW QUESTION # 86

Which two statements are true about creating and using dynamic actions?

- A. Once you create a dynamic action, you cannot add additional true actions.
- B. If a client-side condition is defined, the true action will fire when the condition is met, and the false action will fire when it is not.
- C. You can execute JavaScript code by creating a dynamic action.
- D. If no client-side condition is defined, true actions will not fire.

Answer: B,C

Explanation:

Explanation

Dynamic actions are a declarative way to define client-side behavior without writing JavaScript code. You can create dynamic actions on an item, button, or region of a page by specifying the event, condition, affected elements, action, and other properties.

Some of the statements that are true about creating and using dynamic actions are:

You can execute JavaScript code by creating a dynamic action. One of the supported action types is Execute JavaScript Code, which allows you to enter custom JavaScript code to run when the dynamic action fires.

If a client-side condition is defined, the true action will fire when the condition is met, and the false action will fire when it is not. You can define a client-side condition for a dynamic action to control when it should fire based on an expression or value. You can also define different actions for the true and false branches of the condition. You can add additional true actions to a dynamic action by clicking the Add True Action button in the Property Editor. If no client-side condition is defined, true actions will fire when the event occurs. NEW QUESTION # 87

Which statement is true about the Link Column attribute of an interactive report?

- A. It is not possible to include a custom target in Link Column
- B. It is not possible to exclude Link Column.
- C. A Link Column cannot be sorted, hidden, or moved by an end user.
- D. If you select Link Column, it is always displayed as the last column in the report.

Answer: C

Explanation:

Explanation

A Link Column is a special column type that you can define for an interactive report to create a link to another page, URL, or custom target. A Link Column is always displayed as the first column in the report, regardless of the order of the columns in the query. A Link Column cannot be sorted, hidden, or moved by an end user using the Actions menu or the column header. However, a developer can change the position and visibility of a Link Column by editing the report attributes in Page Designer.

NEW QUESTION # 88

Which three of the following are use cases of Automations?

- A. Approving specific requests
- B. Monitoring log tables and raising an alert when there is an issue
- C. Deleting a database record based on an end user's request
- D. Sending email alerts at a particular time of the week

Answer: A,B,D

Explanation:

Explanation

Automations are a sequential set of PL/SQL actions that are triggered by query results. They are used to monitor data and then perform the appropriate action². Some use cases of automations are:

Monitoring log tables and raising an alert when there is an issue. For example, an automation can query a log table for any errors and send an email notification to the administrator if any errors are found².

Approving specific requests. For example, an automation can query a table for any pending requests and approve them automatically based on some criteria².

Sending email alerts at a particular time of the week. For example, an automation can query a table for any overdue tasks and send a reminder email to the assignees every Monday².

Deleting a database record based on an end user's request is not a use case of automations, as it does not involve querying data and triggering actions based on the query results. This can be achieved by using a PL/SQL process or a dynamic action on the page where the user requests the deletion³⁴.

NEW QUESTION # 89

.....

One of the biggest challenges of preparing for a Oracle 1Z0-770 certification exam is staying motivated. It is easy to get bogged down by all the material you need to learn and lose sight of your goal. That is why our Oracle 1Z0-770 PDF and practice tests are designed to be engaging and easy to understand.
