ISTQB Certified Tester - Performance Testing Sample Questions (Q39-Q44):

NEW QUESTION # 39

At what point during performance testing does monitoring with the load testing tool begin?

- A. Simultaneously with test execution.
- B. Before testing execution.
- C. When testing is concluded.
- D. Immediately after test execution.

Answer: A

Explanation:

Performance monitoring must begin simultaneously with test execution to capture system behavior in real-time. This ensures that bottlenecks and performance issues are identified immediately.

Option A (After testing is concluded) is incorrect because historical monitoring does not help in real-time analysis.

Option B (Before execution) is incorrect because monitoring needs active system load to measure performance.

Option C (Immediately after execution) is incorrect because it misses runtime metrics.

NEW QUESTION # 40

Which of the following is an advantage of using performance monitoring tools?

- A. They can proactively detect denial-of-service (DoS) attacks.
- B. They can prevent malicious behavior.
- C. They proactively compile metrics from server logs.
- D. They more easily identify and report multi-threading problems.

Answer: C

Explanation:

Performance monitoring tools collect real-time and historical performance data, particularly from server logs, application metrics, and infrastructure monitoring. This allows testers to analyze performance trends efficiently.

Option A is incorrect because monitoring tools do not prevent malicious behavior but may detect it.

Option C is incorrect since identifying multi-threading issues is typically done through profiling tools rather than performance monitors.

Option D is incorrect as DoS attack detection falls under security testing.

NEW QUESTION # 41

When following the principal performance testing activities, when are resources allocated?

- A. During test completion
- B. During test planning
- C. During test execution
- D. During test evaluation

Answer: B

Explanation:

Resource allocation happens during the test planning phase, where hardware, tools, and personnel are assigned to the project. This ensures that performance tests are adequately supported.

Option B (Test execution) is when resources are actually used, not allocated.

Option C (Test evaluation) happens after execution to analyze results.

Option D (Test completion) focuses on documentation and reporting.

NEW QUESTION # 42

Which of the following is a key challenge when testing applications in a cloud environment?

- A. Test execution speed being too high
- B. Lack of user behavior simulation tools
- C. Inability to generate significant load
- D. Limited ability to control test execution timing

Answer: D

Explanation:

One of the biggest challenges of cloud-based performance testing is the lack of control over test execution timing due to shared cloud resources. Cloud environments dynamically allocate computing power, meaning that test execution may vary due to background processes, VM migrations, or auto-scaling events.

Option B (Inability to generate load) is incorrect because cloud platforms can scale up resources to generate high loads.

Option C (Lack of behavior simulation tools) is incorrect because cloud providers offer robust testing tools.

Option D (Test execution speed being too high) is not a valid performance testing challenge.

NEW QUESTION # 43

Which of the following is a static performance test?

- A. Evaluation of the test execution skills of the testers
- **B. Review of the network architecture**
- C. Formal signature approval by the end users
- D. Usability test of the user interface

Answer: B

Explanation:

A static performance test is a non-execution-based review that analyzes system architecture, network configurations, and other elements that affect system performance before execution.

Option A (Usability test) is not a static performance test but rather a functional or UX evaluation.

Option B (Evaluation of testers' skills) is unrelated to performance testing.

Option D (Formal signature approval) is an administrative task and not a static test.
