Veeam Certified Engineer v12 Sample Questions (Q79-Q84):

NEW QUESTION # 79

An SMB customer installed Veeam Backup & Replication in a simple deployment. How can the customer comply with the 3-2-1 rule?

- A. Create a Scale-out Backup Repository with object storage in the public cloud used as the capacity tier leveraging copy mode
- B. Copy the backups to a separate local NAS device
- C. Create a Scale-out Backup Repository with object storage in the public cloud used as the capacity tier leveraging move mode
- D. Create a backup to tape job to a local virtual tape library

Answer: A

NEW QUESTION # 80

An engineer is configuring Veeam Backup and Replication for an organization to protect a VMware environment using vSAN. The backup proxy must be isolated from the VMkernel. Which transport mode should the engineer use?

- A. Network mode
- B. Direct NFS access
- C. Direct SAN access
- D. Virtual appliance

Answer: D

Explanation:

When configuring Veeam Backup & Replication in a VMware vSAN environment, the best practice is to use the Virtual Appliance transport mode. This mode is also referred to as "hot-add" and allows the backup proxy to mount VM disks directly from the

datastore. This method is more isolated from the VMkernel network traffic, as it does not require network connectivity to the hosts to retrieve data, thus providing a level of isolation that meets the requirement stated in the question. The Direct NFS and Direct SAN options are not applicable for vSAN, and Network mode would not provide the necessary isolation from VMkernel network traffic.
