Backup Target

Backup can be performed to the following types of storage:

On-premises or cloud-based object storage

Local (internal) storage of the protected computer (not recommended)

Direct attached storage (DAS), such as USB, eSATA or Firewire external drives Network Attached Storage (NAS) able to represent itself as SMB (CIFS) share Veeam Backup & Replication 12 or later backup repository (including deduplication appliances) Veeam Cloud Connect 12 or later cloud repository

NEW QUESTION # 125

Which Veeam Backup & Replication functionality achieves the lowest RPO?

- A. File to Tape
- B. Snapshot-based Replication
- C. Continuous Data Protection
- D. Backup Copy Job

Answer: C

Explanation:

Within Veeam Backup & Replication, the functionality that achieves the lowest Recovery Point Objective (RPO) is B: Continuous Data Protection (CDP). CDP is designed to protect critical workloads by continuously capturing changes and replicating them to a target site, allowing for very low RPOs, often measured in seconds. This is achieved through the use of VMware's vSphere APIs for I/O Filtering (VAIO), which intercepts and replicates I/O streams almost in real-time. CDP is particularly valuable for applications that require high levels of availability and cannot tolerate significant data loss. By providing near-continuous replication, CDP ensures that in the event of a failure or disaster, data loss can be minimized to a very narrow window, significantly reducing the potential impact on business operations.

NEW QUESTION # 126

A backup of a Windows VM running on a VMware Cluster has been created. In which scenario can the Quick Rollback option be used during a Full VM Restore of the VM?

- A. Issues caused by storage data corruption
- **B. Issues caused by VM guest user error**
- C. Migration of VM to Hyper-V host in the same data center
- D. Migration of VM to VMware host in a different data center

Answer: B

NEW QUESTION # 127

When a replication job is configured to use the replica mapping feature (no seeding), what will happen during the first run of the job?

- A. The replication job creates a clone of the mapped replica to preserve the original state before synchronizing the changes from the source infrastructure
- B. The replication job will first restore the VM from the most recent restore point and then start to synchronize the incremental changes from the source infrastructure
- **C. The replication job calculates the differences between the original and mapped VM; only the incremental changes will be synchronized**
- D. If a VM within the replication job is not mapped, the job will fail

Answer: C

NEW QUESTION # 128

An engineer is configuring Veeam Backup and Replication for an organization to protect a VMware environment using vSAN. The backup proxy must be isolated from the VMkernel.

Which transport mode should the engineer use?

- A. Direct NFS access
- B. Direct SAN access
- C. Network mode
- **D. Virtual appliance**

Answer: D

Explanation:

When configuring Veeam Backup & Replication in a VMware vSAN environment, the best practice is to use the Virtual Appliance transport mode. This mode is also referred to as "hot-add" and allows the backup proxy to mount VM disks directly from the datastore. This method is more isolated from the VMkernel network traffic, as it does not require network connectivity to the hosts to retrieve data, thus providing a level of isolation that meets the requirement stated in the question. The Direct NFS and Direct SAN options are not applicable for vSAN, and Network mode would not provide the necessary isolation from VMkernel network traffic.
